Hygienic Valve Technology

Efficiency delivering perfect results

Hygienic valves from GEA form the core component of matrix-piped process plants. Thanks to a pioneering valve concept that sets standards for its flexibility, as well as the latest control and automation functions, our valves offer manufacturers maximum product safety and process reliability.

All GEA hygienic valves are designed to be efficient and cost-effective for their particular applications, leading to sustainable operation and considerable savings potential.

GEA valve technology controls flow processes

Our hygienic valve technology ensures safe, efficient processes wherever sensitive liquid products are manufactured. In food production, the classic application areas range from milk processing (milk, yogurt, cheese ...) to liquid foods (sauces and pastes, instant products, baby food ...) and on to the brewing of beer and production of beverages. Further significant areas are biotechnology and pharmaceuticals, as well as care products and cleaning agents / detergents.

Regardless of the sector, the application or production specifications: Our hygienic valve technology is sure to meet the demands of our users.

Hygienic solutions for every task

Additional components are available to optimize the design of any process plant – from pigging systems for the recovery of valuable products, process connections, and expansion compensators for offsetting thermal stress, to tank safety systems for securing and cleaning tanks and containers.

Supported by our Research and Development Department we regularly launch new, technologically mature products on the markets. Our customers have high standards, which we continuously and systematically meet.

Valves – Setting the Course of the Process

Shut-off valves

Single-seat valves are used for simple shut-off in hygienic applications.

The valves are characterized by their ease of operation and flexibility. To avoid pressure surges, separate types are designed for different flow directions.

Divert valve to distribute products

Divert valve to merge products

Divert valves

Divert valves direct a liquid medium into the right path.

We offer different types: Valves for the distribution of a liquid from one pipe into two pipes as well as valves for the merging of liquids from two pipes into one pipe in blending processes. To avoid pressure surges, separate types are designed for different flow directions.

Mixproof valves

Double-seat mixproof valves provide the shut-off of incompatible media at pipe intersections.

Developed by Otto Tuchenhausen, the founder of GEA's hygienic valve technology range, mixproof valves to this day deliver crucial benefits for safe and secure applications, e.g. in the case of cleaning agents in pipes carrying products. Divert valves are also available as mixproof valves and support the safe construction of an efficient valve matrix.

Tank bottom valves

Tank bottom valves serve to hygienically shut off pipes on tanks or containers.

The various housing connections can be welded directly into the bottom of the tank or mounted flush with the tank bottom wall.

Hygienic Classes for Valves

Increasing variety of products, longer production cycles and changing market conditions are all factors that make the conception of new installations more complex for producers. Additionally, there are higher expectations from the consumers as well as stricter regulations for producers and products. Therefore, engineers have many things to consider when creating suitable solutions for their customers. Our goal is to equip your installation with components that fit your product and your market. To better assist you, we have set up a guideline for choosing the right hygienic component technology according to the Association of German Food Processing Machinery and Packaging Machinery (VDMA).

The hygienic classes can be described by microbiological, physicochemical as well as the resulting organoleptic properties of the product. An important indicator for the classification is its desired shelf-life. The classification is based on the desired characteristics of the final product. Contamination risks and the ability to detect them are important factors for corresponding component designs.

THE BENCHMARK.

GEA VARIVENT® Valve Unit

GEA VARIVENT® Valves

The standard for hygienic valve technology

Wherever future-proof product and process security is essential in liquid processes, the modular GEA VARIVENT® valve system is first choice for systems operators and engineers. Uncompromisingly hygienic valve technology, adaptable to any requirement, permits sustainably economic system and process solutions for a wide variety of the most demanding production tasks.

Safely to safe products

As a pioneering standard for premium quality valve technology, the GEA VARIVENT® modular system offers an unrivalled range of ever-reliable, dead-zone-free valves – from classic single-seat and mixproof double-seat valves to valves with special process functions. A nearly limitless choice and variety of customization, combination and material options meet all hygienic, performance and stress requirements of individual customers. Systematically standardized modules with low parts diversity help cut the operating costs for maintenance and spare parts logistics.

Perfectly in tune: The GEA VARIVENT® valve unit

Pioneering mechanical valve technology and equally advanced options for electronic valve control and system communication combine to form a finely tuned valve unit, increasing valve functionality and safety as well as its cost-efficiency in operation.

Made in Germany – renowned worldwide

The invention of the mixproof valve by Otto Tuchenhausen in Büchen, Germany in 1967 set in motion the triumphant march of the modular VARIVENT® valve series shortly thereafter. To this day, GEA develops and manufactures every GEA VARIVENT® valve unit at the original Büchen site in Germany. The experience of GEA's engineers along with the huge installed base of valve units around the world offer the best guarantee of safety and total reliability. Users benefit continuously from international project developments and ground-breaking innovations which are incorporated into the valve design.

Every GEA VARIVENT® valve unit keeps the promise of "The Benchmark" – the bar for hygienic valve technology.

The Sustainable Choice – 4 is the new 6

16 % savings potential on compressor energy costs and reduction of carbon footprint with 4 bar valve actuators

GEA VARIVENT® hygienic process valves are actuated by compressed air in automated systems, connected to the air supply stations via the digital valve control top. In a pioneering effort, GEA has introduced specially designed 4-bar actuators for all relevant valve types and process applications. This allows operators to reduce the compressed air system pressure, resulting in significant energy savings throughout the plant.

Pioneered by GEA to enable pressure-reduced control air systems

Compressed air is essential for operating automated valve systems and other process equipment. But it comes at a significant cost – typically 10 % – 15 % of the total energy consumption in food and beverage plants. Due to the increasing need to save energy, experts now recommend reducing the air system pressure, estimating an 8 % savings in compressor energy for every 1-bar reduction. Historically, 6 bar has been the standard system pressure in many industries, and available valve actuators are mostly still designed for 6 bar, inhibiting plants from implementing lower pressures.

GEA is leading the way to a more sustainable setup, with 4-bar actuators made available for all GEA VARIVENT® seat valves (single-seat and mixproof) and GEA Hygienic butterfly valves. These 4-bar actuators maintain full reliability of functionality and operation. They can be ordered for retrofit or new valve installations.

GEA VARIVENT® Modular System

The VARIVENT® system is the first – and, to date, the only – valve module to feature a flexible design. Its modular concept offers numerous advantages, such as the standardized forms and connections across all valve types, thereby ensuring that all components can be removed, replaced, combined and expanded without any issues. The result? Cost-efficient system operation, optimized warehousing, economical spare parts and low parts diversity.

Existing valve systems in process plants can be modified or adjusted without the need to alter the overall system concept. The VARIVENT® system remains the benchmark others seek to emulate.

GEA VARIVENT® single seat valve

1 Control and feedback system

Each control top enables intelligent valve control for easy commissioning and increased safety in the process sequence. Detectable valve positions make a decisive contribution to optimal system operation. All common connection types and control systems are available for technical communication in the plant.

2 Actuator

A process-specific selection of the actuator size according to the installation situation results in low air and energy consumption. Depending on the tasks of the valve, various actuator options are available and can be adapted optimally to customer requirements. All actuators can be used in Ex zones as standard, although the Ex-conformity of the electrical add-on components must be taken into account. Furthermore, the actuator contains an integrated interface for mounting a control and feedback system. The internal air supply reduces the risk of failure with external hoses.

4

5

6

GEA VARIVENT® mixproof valve

3 Lifting actuator

Mixproof valves are optionally equipped with a lifting actuator, which enables individual lifting of a single valve disc when cleaning the respective pipe. This allows cleaning of the sealing surfaces in the seat area.

4 Lantern

The open lantern separates the actuator and product parts. It permits visual inspection of the stem seal, and is also used for indicating any leakages. Furthermore, heat transfer from the valve housing to the actuator is prevented. The VARIVENT® valve series enables the integration of additional valve options in the lantern, for example a limit stop or support of up to two proximity switches.

5 Valve disc

The VARIVENT® system offers an extensive number of different valve types for particular applications in process systems. These are mainly characterized by the different configurations of the valve disc. Mix-proof separation of the media is achieved by two mutually independent valve discs, the double disc (upper disc) and the valve disc (lower disc).

6 Valve housing

The height of the dead-zone-free housing exactly corresponds to the inside diameter of the connection pipeline. This avoids domes and sumps with their negative effects such as oxidization damage or cleaning problems. The special ball shape of the housing offers the best flow profiles without flow separation. Depending on the valve design, different seat rings are installed between the valve housings. Optionally, numerous housing combinations are available with either clamped or welded seats.

Hygienic Valves

Technical Characteristics

VARIVENT® and ECOVENT® hygienic valves offer reliable function, are suitable for CIP/SIP, easy to maintain and represent a significant factor in consistent product quality. Low operating, maintenance and service costs ensure economical system productivity.

The VARIVENT® system has a modular structure, which means it offers a high level of flexibility. The result is economic efficiency for the system operator, optimized stock keeping and low-cost spare parts production due to the reduced diversity of parts.

The ECOVENT® valve series is characterized by its compact design. Contrary to the VARIVENT® systems with multiple options, this series provides a simple and efficient solution for standard requirements.

Modular system

Greater flexibility thanks to the ability to adapt rapidly to process changes
High economic efficiency
Low spare part stocks

Hygienic design

Lower risk of contaminating the end product
Maximum efficiency in cleaning
Lower CIP costs

Sealing according to the VARIVENT® principle

The hygienic valves are characterized by special seal technology. A metallic stop results in defined seal deformation, ensuring long seal life. This allows for more time to pass between required maintenance services with the process system, thereby allowing for continuous production and shorter downtimes. The special groove shape in the valve disc makes sure the seal has a secure hold at all times up to a pressure differential of 10 bar during switching. The seal geometry was optimized using FEM calculations.

Hygienic Valves

Technical Characteristics

Pipe classes

Standard VARIVENT® valve housings are supplied with welding ends, although the valves can be delivered with various connection fittings as an option (see section 8).

The dimensions of the welding ends comply with the following standards:

Metric		Inch		
DIN	Outside diameter according to DIN 11866, series A	OD IPS	Outside diameter based on ASME-BPE-a-2004, DIN 11866, series C	Outside diameter according to IPS schedule 5
10	13.0 × 1.50			
15	19.0 × 1.50			
25	29.0 × 1.50	1"	25.4 × 1.65	
40	41.0 × 1.50	1 ½"	38.1 × 1.65	
50	53.0 × 1.50	2"	50.8 × 1.65	60.3 × 2.00
65	70.0 × 2.00	2 ½"	63.5 × 1.65	
80	85.0 × 2.00	3"	76.2 × 1.65	88.9 × 2.30
100	104.0 × 2.00	4"	101.6 × 2.11	114.3 × 2.30
125	129.0 × 2.00			
150	154.0 × 2.00	6"	152.4 × 2.77	168.3 × 2.77

Surfaces

The standard roughness for surfaces in contact with the product is $R_a \leq 0.8 \mu\text{m}$.

Higher-quality surfaces are an available option (see section 8).

Housing surfaces not in contact with the product as well as the lanterns are matt blasted as standard. Alternatively the housings are available with a ground outer surface.

The lanterns of the VARIVENT® Mixproof Valves type MX and the ECOVENT® valves have a bright surface. All actuators of the VARIVENT® and ECOVENT® valves also have a bright surface.

Materials

Components in contact with the product are produced from 1.4404 (AISI 316L), while those not in contact with the product are made from 1.4301 (AISI 304). Other materials, e.g. for use when handling aggressive fluids, are available on request.

For detailed information about the properties of the materials, refer to the material properties table.

Test report and inspection certificate

Optionally, the valve housings and internal components can be supplied with a test report 2.2 or an inspection certificate 3.1 acc. to EN 10204.

If 3.1 inspection certificates are required, please notify us of this when you place the order.

Seal materials

Seals in contact with the product are EPDM (standard), FKM as well as HNBR and TEFASEP® gold (on request; not available for all valve types). NBR material is used for seals not in contact with the product. Other materials for seals in contact with the product are available on request. EPDM will be supplied if no seal material is specified in the orders.

The mixing constituents of our seal materials EPDM and FKM are contained in the FDA White List. In this the sealings are in accordance with FOOD and DRUG (FDA) guidelines 21 CFR Part 177.2600 or 21 CFR 177.1550: "Rubber articles intended for repeated use".

The resistance of the seal material depends on the nature and temperature of the product being transported. The contact time with certain products can negatively affect the service life of seals.

For detailed information about the properties of the seal materials, refer to the seal material properties table.

Other applications on request

* The general resistance of the material does not correspond to the maximum possible operating temperature.

** Inorganic acids are, for example, hydrochloric acid, nitric acid, sulphuric acid

+ = Good resistance

○ = Reduced service life

– = Not resistant

Hygienic Valves

Technical Characteristics

Housing connections

Two alternative housing connections are available: the clamped connection (standard) and the fixed housing connection. The clamped housing selection permits a flexible choice of port orientation.

The advantage of the welded housing connection is that no seals at the seat ring are needed. As a result, the service work during maintenance of the valves is reduced.

Also mix-matched housing combinations (see section 8) are available on request – both with clamped and fixed housing connection, depending on the valve type.

Installation

VARIVENT® and ECOVENT® valves must be installed without stresses. Lateral forces such as expansion of the pipelines due to heat cannot be compensated in the valve, as a result valve damages are possible. In such cases, we recommend taking measures to compensate for the expansion, such as by using the VARICOMP® expansion compensator.

The required clearance for installing and removing a VARIVENT® or ECOVENT® valve is specified in the particular technical data and dimensional sheet.

Recommended flow direction

If possible, the valves should close against the flow direction in order to avoid water hammer.

Ambient conditions

Ambient temperatures

VARIVENT®/ECOVENT® (with connection 0)	0 °C to 45 °C 32 °F to 113 °F
---	----------------------------------

The valves can also be used outdoors. However, in these application areas they must be protected against icing, or else de-iced before switching or lifting. In addition, the particular requirements on the control and feedback system must be taken into account in this case.

The product or operating temperature depends on the seal material and can be seen in the seal material properties table.

Air supply

The valve actuators are configured for operation with min. 4 bar and max. 8 bar air pressure. The standard actuator sizes are configured for an air supply pressure of min. 6 bar (with a product pressure of 5 bar). The quality of the air supply must meet the requirements of ISO 8573-1:2010.

ISO 8573-1:2010

Solid content	Quality class 6
	Particle size max. 5 µm
	Particle density max. 5 mg/m³
Water content	Quality class 4
	Max. dew point 3 °C
	A correspondingly different dew point is required for applications at high altitude or with low ambient temperatures.
Oil content	Quality class 3
	Max. 1 mg oil per 1 m³ air, preferably oil-free

Operating pressure

The valves can be operated down to a negative pressure of –0.95 bar. As standard, the valves are configured for a product pressure up to max. 5 bar (all-round). The maximum product pressure for which the hygienic valves can be configured is 10 bar. Upon request, individual valve types can be supplied with the nominal pressure level of PS20. It should be noted in this case, however, that when switching the valve, the pressure differential between the upper and lower housing is only allowed to be 10 bar.

Actuator types

The modular structure of VARIVENT® valves makes it possible to equip them with different actuator types. As standard, the valves are supplied with a pneumatic actuator with spring return.

The pneumatic actuators are configured for long-term operation, and are maintenance-free. Optionally, additional actuator types are available (see section 8).

Feedback

In the control top

See catalog GEA Valve Automation

In the lantern (LAT)

Proximity switches of size M12×1 can detect the positions “open” and/or “closed”. In double-seat valves with lift actuator, it is also possible to detect the upper valve disc stroke in the lantern by means of a proximity switch (see catalog GEA Valve Automation).

For detecting the end positions by proximity switches in these valves, it is recommended to use the proximity switch holder (INA) on the actuator (see catalog GEA Valve Automation).

Certificates

Hygienic valves in the GEA VARIVENT® family, including ECOVENT® variants, have been designed according to the requirements of the European Hygienic Engineering and Design Group (EHEDG) as well as 3-A Sanitary Standards, Inc. (3-A SSI).

Certificates are available for several valve types. Additionally, numerous valves have been demonstrated to offer trouble-free and efficient cleaning ability not only in accordance with the above guidelines, but also in independent and standardized cleaning tests. The GEA VARIVENT® product family hence offers optimal safety and high potential savings.

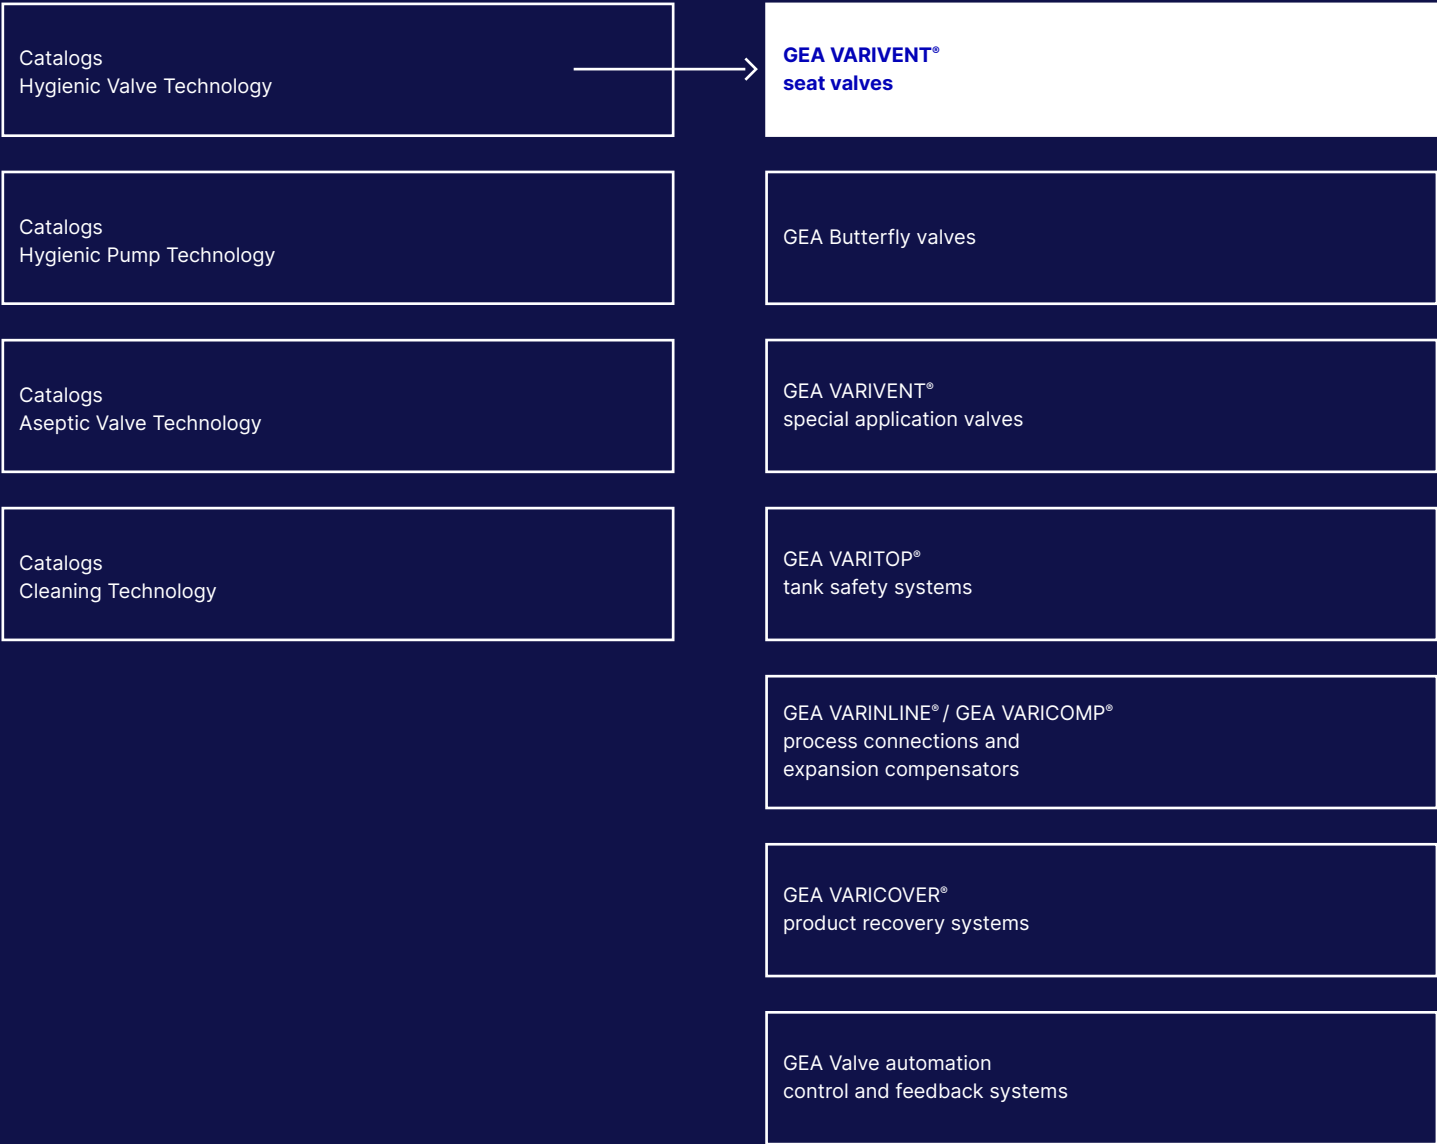

ATEX certificates, CRN, EAC and other additional certificates are available on request for many GEA VARIVENT® valves and for other hygienic valves and components in the GEA portfolio.

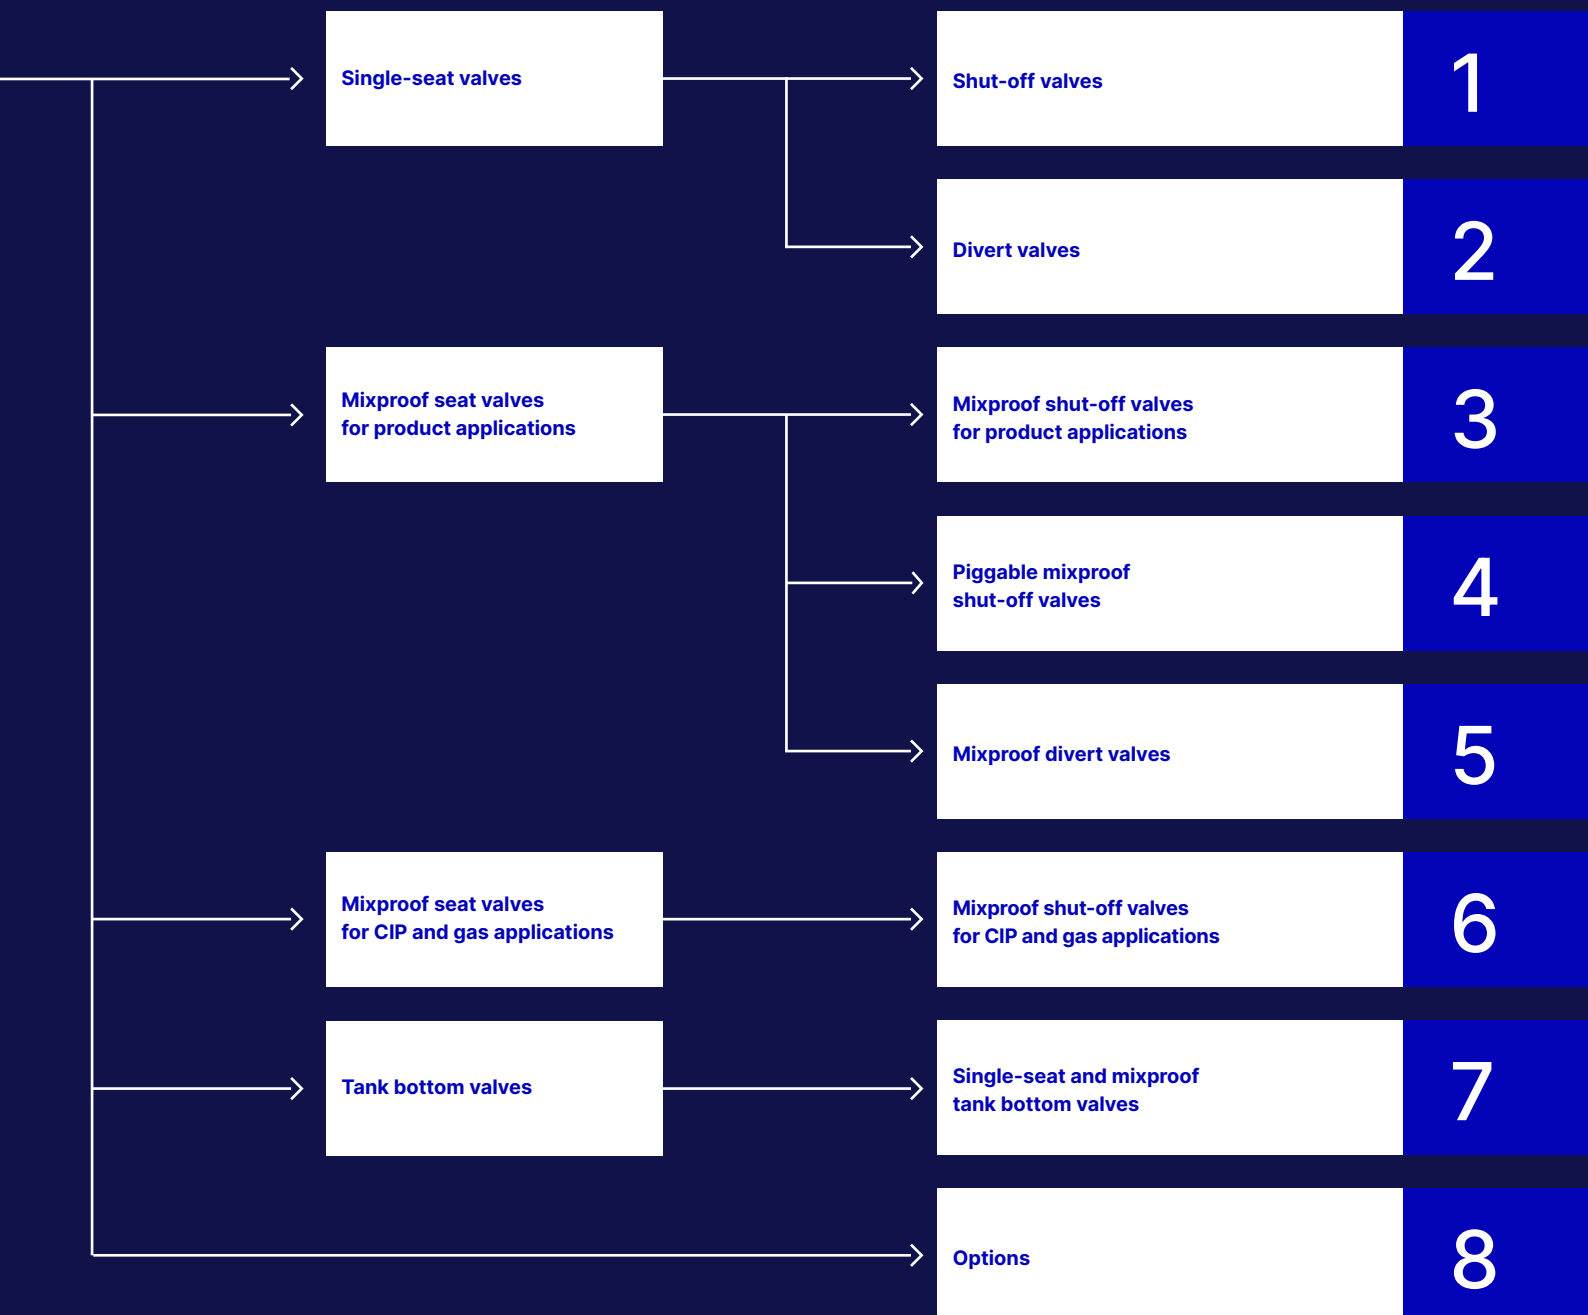

GEA VARIVENT® and ECOVENT® valves comply with the EC Machinery Directive 2006/42/EC and bear the CE mark. They also fulfill the EN ISO 12100:2010 standard for the safety of machinery.

Due to their refined design, the GEA VARIVENT® family, including ECOVENT® variants, also meet the essential health and safety requirements of the EC Pressure Equipment Directive 2014/68/EU.

GEA VARIVENT® and ECOVENT® valves can come into contact with food. Components with the sealing material EPDM or FKM comply with Regulation (EC) No. 1935/2004 of the European Parliament and Council.

Overview of Single-seat Valves

Single-seat shut-off valves

VARIVENT® and ECOVENT® single-seat valves are used for simple shut-off in hygienic applications. The valves are characterized by their ease of operation and flexibility. To avoid water hammers, individual variants in the VARIVENT® modular system are configured for different flow directions.

Special features

Certified, hygienic configuration

Metallic stop

Flexibility because of the modular principle

Proven seal geometry

Availability of two valve series

Overview of Single-seat Valves

Function of the valve

In the simple shut-off, there is only one seal in the one-piece valve disc separating the pipelines from one another. This means liquid can pass from one pipeline to the other in the eventuality of a seal defect. For this reason, single-seat shut-off valves are not suitable for separating incompatible products.

Application examples

In practical use, these valves are used, for example, as emptying/drainage valves or for shutting off a bypass line. Frequently, these types of valve are also used as dosing valves.

The small ECOVENT® valve type N/ECO in nominal widths DN 10 or DN 15 is predominantly used as a feed valve for supplying the spray cleaning of double-seat valves.

The ECOVENT® Angle Valve type NI/ECO implements a flow through the entire nominal width of the pipe. Due to its special design, a horizontal installation orientation of the housing and an upright valve position is absolutely required.

8

VARIVENT®

The structure of the VARIVENT® modular system has many optional versions available to best optimize the valve in the process. Please refer to the options section (section 7) for information about these.

VARIVENT® long-stroke valves are used for transporting fluids with relatively large particles or for viscous products, such as yoghurt with pieces of fruit.

Sizes	
Single-seat shut-off valves	Long-stroke shut-off valves
DN 25–DN 150	DN 65–DN 100
OD 1"–OD 6"	OD 2 ½"–OD 4"
IPS 2"–IPS 6"	

ECOVENT®

The ECOVENT® valve series is characterized by its compact design. Contrary to the VARIVENT® systems with multiple options, this series provides a simple and economical solution for standard requirements.

Sizes	
Single-seat shut-off valves	ECOVENT® Angle valve type NI/ECO
DN 10–DN 100	OD 2 ½"–OD 4"
OD 1"–OD 4"	

Overview of Single-seat Valves

Housing combinations

VARIVENT® and ECOVENT® single-seat shut-off valves are available with an extremely wide range of housing combinations. In addition, it is possible to select between a clamped and a welded housing connection.

Valve seat version

The clamped housing connection is characterized by a high level of flexibility when it comes to installing the valve. The port orientation of the single-seat shut-off valve can thus be adapted to the pipeline system in question.

The advantage of the welded valve seat version lies in its low maintenance requirements, because there are no O-rings between the housings.

In VARIVENT® and ECOVENT® valve types N, both clamped vertical ports (L0) and a one-piece housing (V0) are available for the housing combinations L and T.

5

6

7

8

Maintenance

To ensure being able to service the valve insert when servicing a type U shut-off valve insert, the valve disc must be removed from the pipework through the lower housing or together with the upper housing. For this reason, it is recommended to provide a detachable connection, e.g. a VARIVENT® flange connection, on the relevant housings concerned or in the connected pipe-work system.

The radial sealing shut-off valve type U_R was developed to offer the advantage of a welded valve seat design. This design is characterised by low maintenance requirements. The valve disc with its radial seal can simply be removed upwards through the seat ring. Furthermore, there is no need to replace O-rings in the valve seat.

Valve type U_R

Recommended flow direction

To avoid water hammers when closing the valve while the product is flowing, single-seat shut-off valves should be switched against the flow direction of the product. Valve type N is designed for a flow from the lower to the upper pipeline, whereas valve type U is for the opposite flow direction. Valve type U is only available in the VARIVENT®

series, thus making clear one of the major differences between VARIVENT® and ECOVENT®: the difference in the number of variants available in both series. To avoid water hammers when closing the valve while the product is flowing, ECOVENT® angle valves should be switched against the flow direction of the product.

Overview of Single-seat Valves

Single-seat divert valves

VARIVENT® and ECOVENT® single-seat divert valves are used for simple divert functions in hygienic applications. The valves are characterized by their ease of operation and flexibility. The individual variants are designed for different flow directions.

Special features

Certified, hygienic configuration

Metallic stop

Flexibility because of the modular principle

Proven seal geometry

Availability of two valve series

Overview of Single-seat Valves

Function of the valve

In single-seat divert valves, there is only one seal for each switching position in the valve disc separating the particular pipelines from one another. This means liquid can pass from one pipeline to the other in the eventuality of a seal defect. For this reason, single-seat divert valves are not suitable for separating incompatible fluids.

Application examples

In practice, these valves are frequently used in CIP supply and return lines. One typical application is also found at the end of a valve block in which the valves are fitted as divert valves between the process line and the drainage (e.g. during pushing out).

VARIVENT®

The structure of the VARIVENT® modular system means that different valve configurations (closing direction of the valve disc) and numerous options are available. Please refer to the options section (section 7) for information about these.

VARIVENT® long-stroke valves are used for manufacturing products with relatively large particles or for viscous products, such as strawberry yoghurt.

Sizes	
Single-seat divert valves	Long-stroke divert valves
DN 25–DN 150	DN 65–DN 100
OD 1"–OD 6"	OD 2 ½"–OD 4"
IPS 2"–IPS 6"	

ECOVENT®

The ECOVENT® valve series is characterized by its compact design. Contrary to the VARIVENT® systems with multiple options, this series provides a simple and economical solution for standard requirements.

Sizes
Single-seat divert valves
DN 10–DN 100
OD 1"–OD 4"

Overview of Single-seat Valves

Housing combinations

VARIVENT® and ECOVENT® single-seat divert valves are available with an extremely wide range of housing combinations.

Valve seat version

The valves are configured with a clamped housing connection that is characterized by a high level of flexibility during installation of the valve.

Maintenance

To be able to service the Single-seat Divert Vales type W or X, the valve disc must be removed through the lower housing or together with the upper housing from the pipework. For this reason, it is recommended to provide a detachable connection, e.g. a VARIVENT® flange connection, on the relevant housings concerned or in the connected pipework system.

The radial sealing divert valves type W_R and X_R were developed to offer the advantage of a welded valve seat design. This design is characterised by low maintenance requirements. The one-piece valve disc with its radial seal can simply be removed upwards through the seat rings. Furthermore, there is no need to replace O-rings in the valve seat.

5

6

7

8

Recommended flow direction

The single-seat divert valve type W is used for merging products from two pipelines, whereas valve type X has been designed for product distribution. The valves are characterized by their ease of operation. Valve type X is only available in the VARIVENT® series, thus making clear one of the major differences between VARIVENT® and ECOVENT®: the difference in the number of variants available in both series.

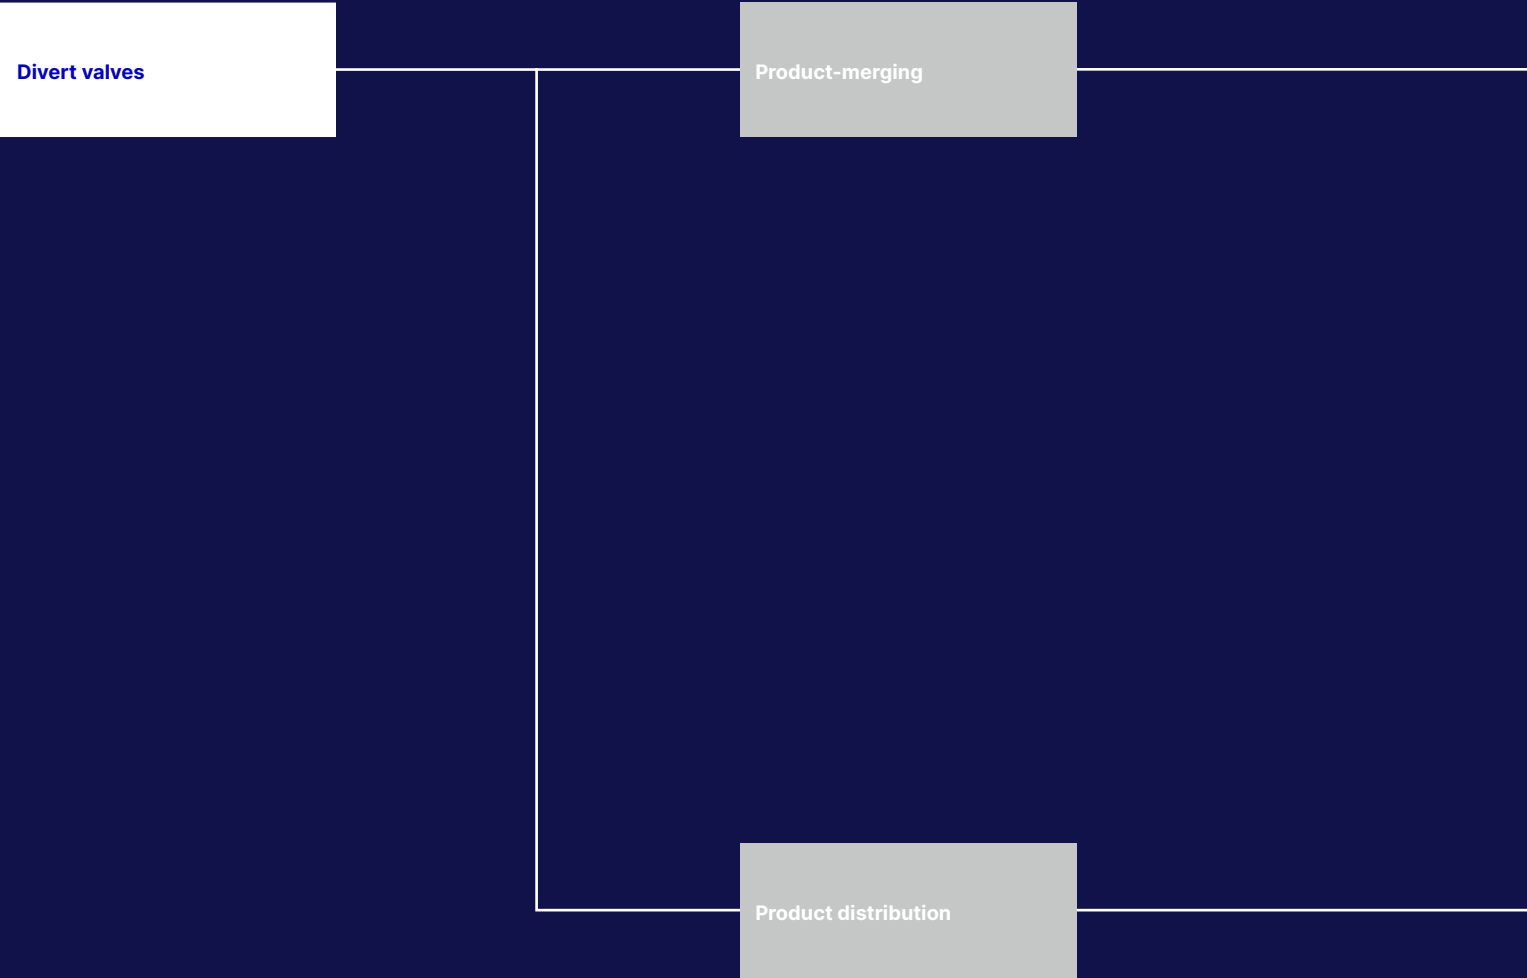

Valve type W
(Spring-to-close, NC)

Valve type X
(Spring-to-close, NC)

VARIVENT® Type W_V

Single-seat Long-stroke Valve

Technical data of the standard version	
Recommended flow direction	Against the closing direction
Material in contact with the product	1.4404 (AISI 316L)
Material not in contact with the product	1.4301 (AISI 304)
Seal material in contact with the product	EPDM, FKM, HNBR
Ambient temperature	0 to 45 °C
Air supply pressure	6.4 bar (93 psi)
Product pressure	DN 65 – DN 80, OD 2 ½" – OD 3": 10 bar (145 psi) DN 100, OD 4": 5.2 bar (75 psi)
Surface in contact with the product	R _a ≤ 0.8 µm
External housing surface	Matt blasted
Control and feedback system	Connection 0 (without control top)
Actuator type	Pneumatic actuator air/spring
Connection fittings	Welding end
Identification	Adhesive ID tag
Valve seat version	Clamped seat ring or fixed vertical port
Marking / Certificates

MIXPROOF SHUT-OFF VALVES FOR PRODUCT APPLICATIONS

VARIVENT® Hygienic Seat Valves

1

2

3

4

5

6

7

8

Overview of Double-seat Valves

VARIVENT® double-seat valves are used for mixproof shut-off of incompatible products at the pipe junctions.

Special features

- Certified, hygienic configuration
- Metallic stop
- Flexibility because of the modular principle
- Proven seal geometry
- Mixproof separation
- Availability of different valve configurations
- Optional spray cleaning connection for cleaning the leakage chamber
- Optional separate lifting actuator to lift both valve discs for cleaning the leakage chamber and valve discs seals

Overview of Double-seat Valves

Function of the valve

When the valve is closed (non-actuated position), there are always two seals between the separated pipelines. If one seal is defective, the resulting leakage will be directed through the leakage outlet into the periphery, without mixing with the product in the second pipeline.

This method enables that there is no mixing between the products from two pipelines.

Next level safety

The optimized physical design of the leakage cavity of the valve types MX, PMO M/2.0 and PMO Cheese Curd M_C/2.0 creates a negative pressure. Should a seal fail or even with no seals, the product is removed by vacuum and guided to the periphery without the risk of contamination (Venturi effect). Two seals are always between the separated pipelines when the valve is closed (non-actuated position).

This method prevents incompatible media from mixing under all conceivable conditions and thus to meet the highest safety requirements.

Application examples

To accommodate the different requirements of various industries, applications and processes, we have a variety of mixproof shut-off valves in our portfolio. The selection matrix provides an overview of all the options.

Sizes

Double-seat valves type D and R	Double-seat valve type B	Double-seat long-stroke valves	Double-seat valve type MX	VARIVENT® 24/7 PMO Valve 2.0	VARIVENT® 24/7 Cheese Curd Valve 2.0

OD 1"–OD 6"	OD 2 ½"–OD 6"	OD 3"–OD 4"	OD 1.5"–OD 6"	OD 1"–OD 6"	OD 2"–OD 4"
IPS2"–IPS 6"	IPS 2"–IPS 6"				

Variety of types

The different variants of the VARIVENT® double-seat valve make it possible to select valves that are optimally adapted to the process.

The axial sealing valve types D and B entail a small switching leakage during each switching procedure, but they notably have a very long service life with the axial seals. The radial sealing valve types R, MX, PMO M/2.0 and PMO Cheese Curd M_C/2.0 offer the advantage of switching nearly without any switching leakage.

Valve types B and R are additionally characterized by a balancer in the lower valve housing. This enables the valve to reliably remain in the closed position even if there are water hammers in the lower pipeline. The valve types MX, PMO M/2.0 and PMO Cheese Curd M_C/2.0 have a balancer on both the (upper) double disc and the (lower) valve disc.

The valve types PMO M/2.0 and PMO Cheese Curd M_C/2.0 are subject to the regulations of the Pasteurized Milk Ordinance (PMO) and are used in all non-aseptic process areas, e.g. milk reception, raw milk storage tanks and distribution systems, pasteurizer supply and return as well as bottling lines.

Switching leakage

In axial sealing double-seat valves, with every switching procedure there is a short time during which the lower valve disc is neither in contact with the middle seal of the upper valve disc, nor has it reached the axial seat surface of the seat ring. During this brief moment liquid can percolate through the resulting gap into the leakage chamber and flow out into the atmosphere. This is referred to as the switching leakage.

In radial sealing double-seat valves, this gap does not occur during the switching procedure, which means the switching leakage is reduced to a minimum (possibility of product residues adhering to the metallic surfaces).

Overview of Double-seat Valves

Water hammer safety

If there is a water hammer in the lower pipeline, the force of the water hammer acts on the lower valve disc and could exceed the locking force of the actuator spring.

This gives rise to the danger of the lower valve disc being lifted by the pressure in the pipeline.

In axial sealing double-seat valves, this would result in a connection to the atmosphere, leading to a leak (see switching leakage). The connection to the atmosphere would also cause a sudden reduction in the excess pressure in the pipeline. Then the actuator spring would close the valve again.

Valve type B with a lower balancer is available to prevent the lower valve disc from lifting during a water hammer in the

lower pipeline. With its downward-facing compensation surface, the balancer adjusts out the operating direction of the pressure and prevents movement of the lower valve disc up to a particular excess pressure.

Radial sealing double-seat valve type R is always equipped with this lower balancer to prevent the opening movement of the lower valve disc.

Radial sealing double-seat valves VARIVENT® Valve type MX, VARIVENT® 24/7 PMO Valve type M/2.0 and VARIVENT® 24/7 Cheese Curd Valve type M_C/2.0 have a balancer on both the (upper) double disc and the (lower) valve disc. Thanks to those specially shaped balancers in both pipelines, the valves retain their full ability to act even in the case of a hydraulic lock or thermal expansion of the medium.

Recommended flow direction

To avoid water hammers when closing the valve while the product is flowing, mixproof shut-off valves should be switched against the flow direction of the product.

Overview of Double-seat Valves

Cleaning the leakage chamber

Different media require different kind of cleaning. Therefore, the VARIVENT® modular system offers double-seat valves with three cleaning options allowing selecting the optimal solution depending on the used media.

Spray cleaning

This kind of leakage chamber cleaning is typically used for fluid media which are easily flushable and do not stick to the seal surfaces or possibly crystallize. All systems related to the cleaning of the valve should regularly be used to ensure an optimal cleaning result and to prevent damages of the valve.

An integrated spray nozzle in the double seat distributes the cleaning medium through the double disc into the leakage chamber. The cleaning medium is supplied via an external cleaning connection located at the height of the lantern. It flows unpressurised through the leakage outlet into the periphery. Cleaning is carried out when the valve is in closed position. Therefore, the leakage chamber can be cleaned independently of pipe cleaning. Product can flow in both pipes during spray cleaning. Intermediate flushing is possible before or after switching the valve. As the valve is in closed position for spray cleaning, the sealing surfaces in contact with the seat ring are not rinsed during cleaning.

Necessary periphery for spray cleaning

As spray cleaning requires external supply of cleaning media via the external cleaning connection located at the height of the lantern, feed valves in the periphery are necessary to channel cleaning media to the cleaning connection on time.

Feed valves with a relatively small nominal diameter are used on the pipe that carries the cleaning medium. Each feed valve usually supplies several cleaning connections of double-seat valves. All connected double-seat valves must be adequately supplied with cleaning medium during cleaning.

Spray cleaning in the double-seat valve

Lifting actuator

This kind of leakage chamber cleaning is typically used for sensitive media which also require cleaning of the seal surfaces to rinse possible adhering microorganisms. It can also be used for adhering and crystalizing media.

The lifting actuator allows separate lifting of each valve disc. The leakage chamber is cleaned during pipe cleaning via lifting the upper or lower valve disc. Cleaning medium passes the seal of the lifted valve disc, cleans the leakage chamber, and flows unpressurized through the leakage outlet into the periphery. As such, all surfaces in contact with the cleaning medium are rinsed, including the surfaces of the valve disc seals. Cleaning is only possible during pipe cleaning.

Double discs (upper valve discs) are always lifted upwards whereas valve discs (lower valve discs) are lifted upwards or downwards depending on the sealing: Axial sealing valve discs are lifted upwards, radial sealing valve discs are lifted downwards.

Lifting actuator and spray cleaning

This kind of cleaning is typically used for critical media which are highly adhesive, easily crystallize and are sticky (e.g., sugar solutions) or viscous (e.g., yoghurt).

The lifting actuator allows cleaning the leakage chamber and valve discs seals during pipe cleaning whereas spray cleaning allows intermediate cleaning of the leakage chamber during production. Short intermediate cleaning is often done after each switching process.

If there is cleaning media in the upper pipeline, the upper valve disc can be lifted to allow the surface of the seal and the leakage chamber to be cleaned.

In the radial sealed double-seat valves type R and MX, the lower valve disc opens downward.

Selection Matrix

VARIVENT® Type D Double-seat Valve

Technical data of the standard version

Material in contact with the product	1.4404 (AISI 316L)
Material not in contact with the product	1.4301 (AISI 304)
Seal material in contact with the product	EPDM, FKM, HNBR
Ambient temperature	0 to 45 °C
Air supply pressure	6 bar (87 psi)
Product pressure	5 bar (73 psi)
Surface in contact with the product	$R_a \leq 0.8 \mu\text{m}$
External housing surface	Matt blasted
Control and feedback system	Connection 0 (without control top)
Actuator type	Pneumatic actuator air/spring

VARIVENT® Type B

Double-seat Valve With Balancer

Technical data of the standard version

Material in contact with the product	1.4404 (AISI 316L)
Material not in contact with the product	1.4301 (AISI 304)
Seal material in contact with the product	EPDM, FKM, HNBR
Ambient temperature	0 to 45 °C
Air supply pressure	6 bar (87 psi)
Product pressure	5 bar (73 psi)
Water hammer safety	Up to 25 bar
Surface in contact with the product	$R_a \leq 0.8 \mu\text{m}$
External housing surface	Matt blasted
Control and feedback system	Connection 0 (without control top)
Actuator type	Pneumatic actuator air/spring
Connection fittings	Welding end
Identification	Adhesive ID tag
Valve seat version	Clamped or welded seat ring
Marking / Certificates

8

Overview of Double-seat Valves

VARIVENT® piggable double-seat valves are used for mixproof shut-off of incompatible fluids at pipe junctions when the valve needs to be piggable in parallel.

Special features

Certified, hygienic configuration

Metallic stop

Flexibility because of the modular principle

Proven seal geometry

Mixproof separation

Different valve configurations available

Optional separate lifting actuator to lift both valve discs for cleaning the leakage chamber and valve discs seals

(Optional) spray cleaning connection for cleaning the leakage chamber

Overview of Double-seat Valves

Function of the valve

When the valve is closed (non-actuated position), there are always two seals between the separated pipelines. If one seal is defective, the resulting leakage will be directed through the leakage outlet into the periphery, without mixing with the product in the second pipeline.

This method enables that there is no mixing between the products from two pipelines.

Application ranges

- Piggable valve blocks
- Piggable filling and emptying valves at product tanks

VARIVENT® double-seat valve type L

The piggable double-seat valve type L is used when incompatible media must be separated mixproof at pipeline junctions and when the valve needs to be piggable in parallel.

Only the lower valve housing with double horizontal ports is piggable, while the upper housing can have one or two horizontal ports. The upper and lower housings are always welded to each other.

Similar to the double-seat valve type R, type L also has the upper valve disc with an axial and the lower one with a radial seal. The double-seat valve type L cannot be equipped with a balancer in the lower housing to protect against pressure hammers.

Radial sealing double-seat valves are optimized to reduce switching leakage to a minimum (possibility of product residues adhering to the metallic surfaces).

The double-seat valve type L can be installed in the standing or suspended position. Compared to type L in suspended position, type L in standing position has a drain valve located between the housings.

This difference is necessary to handle possible leakages in the best manner: When the valve is installed in the standing position and if one seal is defective, the leakage is channeled out mainly via the drain valve located between the housings into the periphery, whereas leakage is channeled out via the leakage housing for valves in the suspended position.

The emptying valve pneumatically connected to the actuator is opened when the valve is closed and closes when the actuator is activated.

In the standing installation orientation of the valve type L, the cleaning media drains from two ports at the same time – through the port above the housings and through the emptying valve.

Cleaning the leakage chamber

Different media require different kind of cleaning. Therefore, the VARIVENT® modular system offers double-seat valves with three cleaning options allowing selecting the optimal solution depending on the used media.

Spray cleaning

This kind of leakage chamber cleaning is typically used for fluid media which are easily flushable and do not stick to the seal surfaces or possibly crystallize. All systems related to the cleaning of the valve should regularly be used to ensure an optimal cleaning result and to prevent damages of the valve.

An integrated spray nozzle in the double seat distributes the cleaning medium through the double disc into the leakage chamber. The cleaning medium is supplied via an external cleaning connection located at the height of the lantern. It flows unpressurised through the leakage outlet into the periphery. Cleaning is carried out when the valve is in closed position. Therefore, the leakage chamber can be cleaned independently of pipe cleaning. Product can flow in both pipes during spray cleaning. Intermediate flushing is possible before or after switching the valve. As the valve is in closed position for spray cleaning, the sealing surfaces in contact with the seat ring are not rinsed during cleaning.

Necessary periphery for spray cleaning

As spray cleaning requires external supply of cleaning media via the external cleaning connection located at the height of the lantern, feed valves in the periphery are necessary to channel cleaning media to the cleaning connection on time.

Feed valves with a relatively small nominal diameter are used on the pipe that carries the cleaning medium. Each feed valve usually supplies several cleaning connections of double-seat valves. All connected double-seat valves must be adequately supplied with cleaning medium during cleaning.

Lifting actuator

This kind of leakage chamber cleaning is typically used for sensitive media which also require cleaning of the seal surfaces to rinse possible adhering microorganisms. It can also be used for adhering and crystalizing media.

The lifting actuator allows separate lifting of each valve disc. The leakage chamber is cleaned during pipe cleaning via lifting the upper or lower valve disc. Cleaning medium passes the seal of the lifted valve disc, cleans the leakage chamber, and flows unpressurized through the leakage outlet into the periphery. As such, all surfaces in contact with the cleaning medium are rinsed, including the surfaces of the valve disc seals. Cleaning is only possible during pipe cleaning.

Lifting actuator and spray cleaning

This kind of cleaning is typically used for critical media which are highly adhesive, easily crystallize and are sticky (e.g., sugar solutions) or viscous (e.g., yoghurt).

The lifting actuator allows cleaning the leakage chamber and valve discs seals during pipe cleaning whereas spray cleaning allows intermediate cleaning of the leakage chamber during production. Short intermediate cleaning is often done after each switching process.

MIXPROOF DIVERT VALVES

VARIVENT® Hygienic Seat Valves

1

2

3

4

5

Overview of Double-seat Valves

VARIVENT® mixproof divert valves are used for distributing liquid in pipelines, i.e. for distributing a liquid from one pipeline into two others, in which case one of the two pipelines must be shut off from the outlet line with a mixproof function.

Special features

Certified, hygienic configuration

Metallic stop

Flexibility because of the modular principle

Proven seal geometry

Mixproof separation

Optional separate lifting actuator to lift both valve discs for cleaning the leakage chamber and valve discs seals

(Optional) spray cleaning connection for cleaning the leakage chamber

6

7

8

Overview of Double-seat Valves

Application examples

The typical application for valve type Y with changeover function is the divert function after a pasteurizer. For this application, the VARIVENT® mixproof divert valve type Y has been approved by the German Federal Dairy Research Center in Kiel for use after a pasteurizer.

The VARIVENT® Flow Diversion Device type X_R is designed to meet US PMO requirements. Due to the adaption of two divert valves, leak detection is ensured with a cavity in the same nominal size as the pipes diameter. The typical application is the divert function after a pasteurizer in the dairy industry.

Mixproof divert function after a pasteurizer

Mixproof divert function downstream of a pasteurizer

VARIVENT® mixproof divert valve type Y

P & I Diagram

R & I diagram

VARIVENT®

The VARIVENT® modular system has many options available. Please refer to the options section (section 8) for information about these.

Sizes	
VARIVENT® mixproof divert valve type Y	VARIVENT® Flow Diversion Device
DN 25–DN 150	
OD 1"–OD 6"	OD 1"–OD 4"
IPS 2"–IPS 6"	

The VARIVENT® mixproof divert valve type Y offers the possibility of mixproof separation and changeover back to the pasteuriser.

The VARIVENT® Flow Diversion Device consists of two radial sealing divert valves of type XKR or XWR that form a module with fixed connection. The mixproof valve combination is used to permit the properties “flow division”, “leakage detection” or “forward flow” downstream of every pasteurizer. It is ensured that there are always two seals between pasteurized and non-pasteurized milk.

Mixproof Separation

GEA Flow Diversion Device (FDD) type X_R

Function of the valve

When the valve is closed (non-actuated position), there are always two seals between the middle and upper pipeline. If one seal is defective at this point, the resulting leakage can be deliberately channelled through the leakage outlet into the periphery, without mixing with the product in the second pipeline. The shut-off between the middle and lower housing is performed with only one seal, and is not suitable for separating two incompatible media.

This method enables that there will not be any mixture between the products in the pipelines.

Switching leakage

In axial sealing double-seat valves, with every switching procedure there is a short time during which the lower valve disc is neither in contact with the middle seal of the upper valve disc, nor has it reached the axial seat surface of the seat ring. During this brief moment liquid can percolate through the resulting gap into the leakage chamber and flow out into the atmosphere. This is referred to as the switching leakage.

Recommended flow direction

To avoid water hammers when closing the valve while the product is flowing, mixproof divert valves should be switched against the flow direction of the product.

Overview of Double-seat Valves

Cleaning the leakage chamber

Different media require different kind of cleaning. Therefore, the VARIVENT® modular system offers double-seat valves with three cleaning options allowing selecting the optimal solution depending on the used media.

Spray cleaning

This kind of leakage chamber cleaning is typically used for fluid media which are easily flushable and do not stick to the seal surfaces or possibly crystallize. All systems related to the cleaning of the valve should regularly be used to ensure an optimal cleaning result and to prevent damages of the valve.

An integrated spray nozzle in the double seat distributes the cleaning medium through the double disc into the leakage chamber. The cleaning medium is supplied via an external cleaning connection located at the height of the lantern. It flows unpressurised through the leakage outlet into the periphery. Cleaning is carried out when the valve is in closed position. Therefore, the leakage chamber can be cleaned independently of pipe cleaning. Product can flow in both pipes during spray cleaning. Intermediate flushing is possible before or after switching the valve. As the valve is in closed position for spray cleaning, the sealing surfaces in contact with the seat ring are not rinsed during cleaning.

Necessary periphery for spray cleaning

As spray cleaning requires external supply of cleaning media via the external cleaning connection located at the height of the lantern, feed valves in the periphery are necessary to channel cleaning media to the cleaning connection on time.

Feed valves with a relatively small nominal diameter are used on the pipe that carries the cleaning medium. Each feed valve usually supplies several cleaning connections of double-seat valves. All connected double-seat valves must be adequately supplied with cleaning medium during cleaning.

Spray cleaning in the double-seat valve

Application example of a feed valve

Lifting actuator

This kind of leakage chamber cleaning is typically used for sensitive media which also require cleaning of the seal surfaces to rinse possible adhering microorganisms. It can also be used for adhering and crystalizing media.

The lifting actuator allows separate lifting of each valve disc. The leakage chamber is cleaned during pipe cleaning via lifting the upper or lower valve disc. Cleaning medium passes the seal of the lifted valve disc, cleans the leakage chamber, and flows unpressurized through the leakage outlet into the periphery. As such, all surfaces in contact with the cleaning medium are rinsed, including the surfaces of the valve disc seals. Cleaning is only possible during pipe cleaning.

Double discs (upper valve discs) are always lifted upwards whereas valve discs (lower valve discs) are lifted upwards or downwards depending on the sealing: Axial sealing valve discs are lifted upwards, radial sealing valve discs are lifted downwards.

Lifting actuator and spray cleaning

This kind of cleaning is typically used for critical media which are highly adhesive, easily crystallize and are sticky (e.g., sugar solutions) or viscous (e.g., yoghurt).

The lifting actuator allows cleaning the leakage chamber and valve discs seals during pipe cleaning whereas spray cleaning allows intermediate cleaning of the leakage chamber during production. Short intermediate cleaning is often done after each switching process.

If there is cleaning media in the upper pipeline, the upper valve disc can be lifted up to allow the cleaning of the surface of the seal and the leakage chamber to be cleaned.

If there is cleaning media in the lower pipeline, valve type Y permits lifting of the lower valve disc upwards.

MIXPROOF SHUT-OFF VALVES FOR CIP AND GAS APPLICATIONS

VARIVENT® Hygienic Seat Valves

1

2

3

4

5

6

7

8

Overview

VARIVENT® double-seat valves type K and VARIVENT® double-seat valves type C are used for mixproof shut-off of incompatible products at the pipe junctions in CIP or gas applications.

Special features

Certified, hygienic configuration

Metallic stop

Flexibility because of the modular principle

Proven seal geometry

Mixproof separation

Availability of different valve configurations

Overview

Application examples

VARIVENT® double-seal valve type C and double-seat valve type K are predominantly used in areas where hygiene is not critical, e.g. CIP systems and gas blocks (brewery).

Mixproof separation

VARIVENT® mixproof valves type C and K are used as economic alternatives for mixproof separation of incompatible products at pipeline junctions within CIP systems or gas blocks.

When the valve is closed (non-actuated position), there are always two seals between the separated pipelines. If one seal fails, the resulting leakage will be directed through the leakage outlet into the periphery, without mixing with the product in the second pipeline.

VARIVENT®

The VARIVENT® modular system has many available versions for optimizing the valves in the process system. Please refer to the options section (section 8) for information about these.

4

5

6

7

8

The valve types

Valve type K represents a typical double-seat valve with two independent valve discs in which these two seals are located.

Valve type C is a double-seat valve in which these two seals are located in one valve disc together with the leakage chamber in between them.

In both versions, two seals prevent any mixture between two different medias.

Recommended flow direction

To avoid water hammers when closing the valve while the product is flowing, mixproof shut-off valves should be switched against the flow direction of the product. That means, for VARIVENT® mixproof valves type C and K, the recommended flow direction of the product is from the lower to the upper housing,

Double-seat valve
type K

Double-seat valve
type C

Overview

Cleaning the leakage chamber

Double-seat valve type C

In the standard version, two flush valves are connected to the leakage chamber between the two valve disc seals. One flush valve is always used for the leakage outlet, while the second flush valve is in contact with cleaning media through an cleaning connection, in order to clean the leakage chamber.

In this case, it is necessary to have a supply valve connected in the periphery to supply the flush valve with cleaning media on time.

Cleaning takes place while the main valve is closed, which means the seal surfaces of the valve disc seals that are in contact are not rinsed.

Double-seat valve type K

The double-seat valve type K does have neither an external spraying connection nor a lifting actuator. The leakage chamber is flushed by the fluid that flow out from the leakage chamber as a result of the switching leakage during the main stroke. For this reason, the valve is not suitable for use in hygienic areas.

The advantages of the valve type K are its slightly increased safety against water hammers that could occur in the lower pipeline, as well as having a wider selection of available housing combinations.

Valve closed,
leakage detection
via flush valves

Valve open,
flush valves closed

TANK BOTTOM VALVES

VARIVENT® Hygienic Seat Valves

1

2

3

4

5

6

7

8

Overview

VARIVENT® tank bottom valves are used for shutting off pipelines at tanks or containers. Various housing connections can be welded directly into the tank bottom, flush mounted into the tank bottom wall.

Special features

- Certified, hygienic configuration
- Metallic stop
- Flexibility because of the modular principle
- Proven seal geometry
- Mixproof separation
- Availability of different valve configurations

Overview of Single-seat and Double-seat Bottom Valves

VARIVENT®
The VARIVENT® modular system has many options available. Please refer to the options section (section 8) for information about these.

Sizes
Tank bottom valves
DN 25–DN 150
OD 1"–OD 6"
IPS 2"–IPS 6"

Application examples
Single-seat tank shut-off valves with only one sealing (either axial or radial) between the tank and pipeline as well as mix-proof radial sealing tank bottom valves are available.

Single-seat tank shut-off valves are used if the tank is operated with separate filling and emptying lines. It is not possible to clean the pipeline while the tank is in process.

Mixproof tank shut-off valves are used if the tank is operated with common filling and emptying lines. Mixproof separation between the pipeline and the inside of the tank allows the pipework to be cleaned while the process in the tank continues.

In the classic variant, the mixproof tank shut-off valve separates the process in the tank from the supply to the downstream valve matrix so that the tanks can be filled, emptied and cleaned flexibly and in parallel.

For some time now, mixproof tank bottom valves have been installed horizontally on a special connection unit directly below the tank as ECO-MATRIX™. In this case, the process lines do not converge in a valve matrix, but are routed directly underneath the tanks in order to save space.

Maintenance

In order to be able to service the valve insert when servicing a single-seat axial sealing type U shut-off valve, the valve disc must be removed from the pipework through the tank or together with the housing. For this reason, it is recommended to provide a detachable connection, e.g. a VARIVENT® flange connection, on the respective housings or in the connected pipework.

The design of the radially sealing shut-off valve type U_R is characterised by low maintenance requirements. The valve disc with its radial seal can be easily removed upwards through the seat ring.

Mixproof separation

When the valve is closed (non-actuated position), there are always two seals between the two fluids in the mix-proof variant. If one seal is defective, the resulting leakage can be deliberately channelled out of the leakage housing into the periphery. This method enables that there cannot be any mixture between a tank and a pipeline.

Mixproof separation
by two seals

Overview of Single-seat and Double-seat Bottom Valves

Cleaning the leakage chamber

Different media require different kind of cleaning. Therefore, the VARIVENT® modular system offers double-seat valves with three cleaning options allowing selecting the optimal solution depending on the used media.

Spray cleaning

This kind of leakage chamber cleaning is typically used for fluid media which are easily flushable and do not stick to the seal surfaces or possibly crystallize. All systems related to the cleaning of the valve should regularly be used to ensure an optimal cleaning result and to prevent damages of the valve.

An integrated spray nozzle in the double seat distributes the cleaning medium through the double disc into the leakage chamber. The cleaning medium is supplied via an external cleaning connection located at the height of the lantern. It flows unpressurised through the leakage outlet into the periphery. Cleaning is carried out when the valve is in closed position. Therefore, the leakage chamber can be cleaned independently of pipe cleaning. Product can flow in both pipes during spray cleaning. Intermediate flushing is possible before or after switching the valve. As the valve is in closed position for spray cleaning, the sealing surfaces in contact with the seat ring are not rinsed during cleaning.

Necessary periphery for spray cleaning

As spray cleaning requires external supply of cleaning media via the external cleaning connection located at the height of the lantern, feed valves in the periphery are necessary to channel cleaning media to the cleaning connection on time.

Feed valves with a relatively small nominal diameter are used on the pipe that carries the cleaning medium. Each feed valve usually supplies several cleaning connections of double-seat valves. All connected double-seat valves must be adequately supplied with cleaning medium during cleaning.

Spray cleaning with tank bottom valve

Lifting actuator

This kind of leakage chamber cleaning is typically used for sensitive media which also require cleaning of the seal surfaces to rinse possible adhering microorganisms. It can also be used for adhering and crystalizing media.

The lifting actuator allows separate lifting of each valve disc. The leakage chamber is cleaned during pipe cleaning via lifting the upper or lower valve disc. Cleaning medium passes the seal of the lifted valve disc, cleans the leakage chamber, and flows unpressurized through the leakage outlet into the periphery. As such, all surfaces in contact with the cleaning medium are rinsed, including the surfaces of the valve disc seals. Cleaning is only possible during pipe cleaning.

Double discs (upper valve discs) are always lifted upwards whereas valve discs (lower valve discs) are lifted upwards or downwards depending on the sealing: Axial sealing valve discs are lifted upwards, radial sealing valve discs are lifted downwards.

Lifting actuator and spray cleaning

This kind of cleaning is typically used for critical media which are highly adhesive, easily crystallize and are sticky (e.g., sugar solutions) or viscous (e.g., yoghurt).

The lifting actuator allows cleaning the leakage chamber and valve discs seals during pipe cleaning whereas spray cleaning allows intermediate cleaning of the leakage chamber during production. Short intermediate cleaning is often done after each switching process.

If there is cleaning media in the pipeline, the lower valve disc (double disc lift) can be lifted into the pipeline to allow the surface of the seal and the leakage chamber to be cleaned.

The upper valve disc (valve disc lift) of the bottom valve can be lifted in the direction of the tank. This makes it possible to clean the seal surfaces and the leakage chamber. For this purpose, the liquid should be stored in advance at an adequate level in the tank.

Overview of Single-seat and Double-seat Bottom Valves

VARIVENT® 24/7 PMO Tank Valve

VARIVENT® 24/7 PMO Tank Bottom Valve

The VARIVENT® 24/7 PMO Tank Valve type MT is the first tank valve to be authorized by the FDA (under Memorandum M-b-359) to implement seat lifting cleaning while product is present in one housing of the valve – saving even more time, money and production downtime for US dairy plants.

Like the VARIVENT® 24/7 PMO Valve type M/2.0 and VARIVENT® 24/7 PMO Cheese Curd Valve type M_C/2.0, using simple geometry and ensures no CIP impingement on the opposite seat during seat lift cleaning. These two design features ensure that there can never be any cross-leakage of CIP liquid into the opposite valve housing during seat lifting.

Special features

Compact design: Completely drainable in horizontal or upside-down positions, saving floor space

Greatly simplified vessel pipework: Can be connected to the silo or vat

Increased process flexibility and reduced production downtime: Allows the vessel inlet/outlet header to be cleaned while product is present in the vessel

VARIVENT® housing connection flange type T and T-S

The housing connection flanges type T and T-S serve to adapt VARIVENT® and ECOVENT® tank bottom valves free of dead zones to vessels. The connection flanges are designed for installation into vessels of a wall thickness up to 8 mm and are welded into the tank or vessel wall flush from the inside.

The housing connection flange type T is best suited for insertion in the cone or dished bottom. Welding into the vessel wall is also possible with larger vessels. Due to its cylindrical shape, the housing connection flange of type T-S allows adjustment to the inclination or curve of the vessel bottom or vessel wall and is thus suitable for installation in tanks with smaller diameters.

VARIVENT® housing connection flange type U and U-S

The housing connection flange type U is used to adapt VARIVENT® and ECOVENT® tank bottom valves to vessels. Preferably, the flange is welded into the tank or vessel wall front-flush, centrally in the cone or dished bottom or in extrusions with a wall thickness of up to 4 mm.

The housing connection flange type U-S is used for vertical holding of a seat valve free of dead zones. Its cylindrical shape allows the adjustment to the inclination of the cone or dished bottom and therefore allows for vertical installation of VARIVENT® and ECOVENT® tank bottom valves outside the center vessel bottom. The housing connection flanges type U-S are particularly suitable for installation of components at jacketed tanks due to their cylindrical form.

VARIVENT®

Housing Connection Flanges

The VARIVENT® housing connection flanges are welded into the vessel wall or the vessel bottom with a welding jig to protect against distortion. Since the different heat introduction when welding may cause deformation of the flanges and

thereby leaks, the flange with the installed welding jig must be allowed to cool off to 30 °C. All conditions required for welding (such as insert gas, cooling, welding additive) can be taken from the respective welding instructions.

Installation position

Depending on the installation situation there are different housing connection flanges that allow the adaption of VARIVENT® and ECOVENT® tank bottom valves in a wide variety of positions.

Installation position at the tank	Suitable connection or tank flange			
	Type U	Type U-S	Type T	Type T-S
A		•	•	•
B		•		•
C		•	•	•
D			•	•*
E	•		•	

* In this installation position, there may be slight accumulations of liquid.

The different connection positions on the tank make it necessary to adapt the contour of the welded joint from the inside of the tank. The housing connections U-S and T-S were developed for installation in tanks with smaller diameter or insulated tanks.

Please refer to the tables below for the minimum tank diameter required for the adaption.

VARIVENT® Housing connection type U

Housing connection U-S

Housing connection T-S

Technical data of the standard version

Recommended flow direction	Against the closing direction
Material in contact with the product	1.4404 (AISI 316L)
Material not in contact with the product	1.4301 (AISI 304)
Seal material in contact with the product	EPDM, FKM, HNBR
Ambient temperature	0 to 45 °C
Air supply pressure	6 bar (87 psi)
Product pressure	5 bar (73 psi)
Surface in contact with the product	$R_a \leq 0.8 \mu m$
External housing surface	Matt blasted
Control and feedback system	Connection 0 (without control top)
Actuator type	Pneumatic actuator air/spring
Connection fittings	Welding end
Identification	Adhesive ID tag
Valve seat version	Clamped seat ring
Marking / Certificates	

* Optionally with housing connection flange U or housing connection flange T (see position 13)

Options – Supplement to the Valve Type

VARIVENT® Lifting Actuator

Typical application and description

In a double-seat valve, in order to clean the two valve discs, inclusive seal surfaces and the leakage chamber, by using seat lifting, an additional lifting actuator is installed to lift the main actuator and the lantern.

The lifting actuator is supplied with air via the two connections provided on the particular control and feedback system. Both valve discs can be activated separately using this lifting actuator.

The configuration and required size of lifting actuator is determined by GEA Tuchenhausen. When ordering, it is necessary to specify the prevailing product pressure, as well as the available air supply pressure, or to select an appropriate combination from one of the actuator selection sheets.

Available nominal widths		
Metric	DN	25–150
Inch OD	OD	1"–6"
Inch IPS	IPS	2"–6"

Available valve types	
Single-seat valves with shut-off function	–
Single-seat valves with divert function	–
Mixproof valves with shut-off function	D, B, R, MX, M
Piggable mixproof valves with shut-off function	L
Mixproof valves with divert function	Y
Mixproof shut-off valves for CIP and gas applications	–
Tank bottom valves	T, MT

Technical data	
Material	1.4301 (AISI 304)
Outside surface	Turned, $R_a \leq 1.6 \mu\text{m}$

Type	Dimensions		
No. 8 in the order code	D2 [mm]	H [mm]	Weight [kg]
/BL_	110	120	4.6
/CL_	135	120	5.8
/DL_	170	120	8.0
/EL_	210	120	10.5
/CL_5	135	130	4.9
/DL_5	170	130	8.3
/EL_5	210	130	10.8
/EL_6	210	158	15.7
/SL_6	260	158	21.0

The lifting actuator also has a supplement, depending on the valve type or nominal width.

Incorporation of the option in the order code and example

Position	Description of the order code for options	
3	Supplement to the valve type	
	L	With lifting actuator and spray cleaning
	C	With lifting actuator without spray cleaning
8	Actuator (spring-to-close) / Lifting actuator	
	... / ...	Required combination of main actuator / lifting actuator acc. to actuator selection sheet (e.g. EG/ELB)

Position	1	2	3		4/5		6	7		8		9		10	11	12	13		14 to 19

Options – Supplement to the Valve Type VARIVENT® Conversion Kit Bellows, Stainless Steel

Typical application and description

Conversion of a VARIVENT® hygienic valve type N into a sterile version within existing systems.

For more sensitive applications, single-seat valves in existing systems can be modified by using bellows, e.g. for use in highly hygienic applications. Not only the bellows but also a lantern, adapter and securing clip are supplied for the conversion.

Please contact GEA Aseptomag AG if you are planning new aseptic applications!

Available nominal widths

Metric	DN	25–100
Inch OD	OD	1"–4"

Available valve types

Single-seat valves with shut-off function	N
Single-seat valves with divert function	–
Mixproof valves with shut-off function	–
Piggable mixproof valves with shut-off function	–
Mixproof valves with divert function	–
Mixproof shut-off valves for CIP and gas applications	–
Tank bottom valves	N

Options – Supplement to the Valve Type VARIVENT® Conversion Kit Bellows, PTFE

Typical application and description

Conversion of a VARIVENT® hygienic valve type N into a sterile version within existing systems.

For more sensitive applications, single-seat valves in existing systems can be modified by using a bellows, e.g. for use in highly hygienic applications. Not only the bellows but also a lantern, adapter and securing clip are supplied for the conversion. Product versions with 3-A certificate are optionally available.

Please contact GEA Aseptomag AG if you are planning new aseptic applications!

Options – Supplement to the Valve Type VARIVENT® Conversion Kit D-tec® for Shut-off Valves

Typical application and description

From Hygienic to UltraClean – D-tec® conversion kit for VARIVENT®

The D-tec® conversion kit makes it possible to convert existing systems from a hygienic stem diaphragm sealing to the D-tec® diaphragm for achieving UltraClean production conditions. Using components that prevent exchange with the exterior atmosphere simplifies the production of demanding and sensitive products and advances product shelf life.

D-tec® valves are used especially in the food, beverages, biotech and dairy industries. Product versions with 3-A certificate are optionally available.

Please contact GEA Aseptomag AG if you are planning new aseptic applications!

Options – Housing and Nominal Widths VARIVENT® Jacketed Valve Housing

Typical application and description

For keeping chocolate or margarine fluid and for cooling ice cream.

For heating or cooling products, a hot or cold medium is passed through the housing jacket in the opposite flow direction.

The product range includes jacketed valve housings with both one and two horizontal ports. However, the housings cannot be supplied for valves with mix-matched nominal widths or a welded seat ring.

Available nominal widths

Metric	DN	25–100
Inch OD	OD	1"–4"

Options – Housing and Nominal Widths

VARIVENT® Housing with Increased Pressure Level

Typical application and description

For static use of valves with increased product pressure. For increasing the strength, the half rings on the valve housings are made of cast material and the housings with nominal widths DN 100 /OD 4" are made of a higher-quality material.

IMPORTANT: The differential pressure between the product chambers on both sides of the valve disc is not allowed to exceed 10 bar during switching of the valve. The actuator size of the valve must be selected based on the product data.

Options – Housing and Nominal Widths

Mix-Matched Housing Combinations

Typical application and description

Many mix-matched housings are already available. [For technical reasons, however, a mix-matched combination is not possible for all valve types! If required, please contact GEA Tuchenhausen to ask about the feasibility.](#)

The first mentioned nominal width indicates the upper valve housing, the second one is the nominal width of the lower valve housing. In divert valves, both upper housings are configured with the same nominal width. The larger housing in the mix-matched combination must always be configured as a housing with two ports.

Available nominal widths		
Metric	DN	25–150
Inch OD	OD	1"–6"
Inch IPS	IPS	2"–6"

Available valve types	
Single-seat valves with shut-off function	N, U, N/ECO
Single-seat valves with divert function	W, X, W/ECO
Mixproof valves with shut-off function	D, B, R, MX*, M*
Piggable mixproof valves with shut-off function	–
Mixproof valves with divert function	–
Mixproof shut-off valves for CIP and gas applications	K
Tank bottom valves	–

* Only welded valve seat version

Technical data	
Material	1.4404 (AISI 316L)
Product pressure	10 bar
Valve seat version	Clamped or welded valve seat version

Options – Housing and Nominal Widths

Vertical Ports Suitable For Orbital Welding

Typical application and description

The orbital welding process is used in pipeline construction when high weld qualities have to be achieved under controllable conditions.

The extended vertical port (dimension B) makes it possible to weld in the housing using welding tongs or an orbital welding head.

Options – Housing and Nominal Widths

Tangential Valve Housings

Typical application and description

Horizontal tank valves or horizontally installed valves are configured so the connection piping can be completely drained.

Tangential valve housings are provided with eccentrically welded-on vertical ports, as a result, no fluid remains in the housing sphere of the horizontal installation.

Various nominal widths are available. If required, please contact GEA Tuchenhausen to ask about the dimensions and feasibility.

Options – Actuators

VARIVENT® Actuator Air/Spring

Typical application and description

As one of the basic elements of the VARIVENT® modular system, the actuator air/spring is used for performing the valve movement in all VARIVENT® valves.

The air supply is connected to the particular control and feedback system and led via the internal air channel under the piston surface of the actuator. Simply by reversing the actuator, it is possible to convert the fail-safe position of the valve (in single-seat valves) from spring-to-close (NC) to spring-to-open (NO). In these cases, or if the product or air supply pressure differs from the standard, check the definition of the actuator size based on the order code and the selection sheets onwards.

Reliable switching actuators are available for all relevant valve types with a control air pressure from minimum 4 bar. Selection tables for choosing the required actuator size can be found at the end of this section.

Available nominal widths

ECOVENT® Actuator Air/Spring for Application with Feedback System

Typical application and description

As one of the basic elements of the ECOVENT® valves, the air/spring actuator type ECO-E is used for performing the valve movements in all ECOVENT® valves.

The air supply is connected to the particular control and feedback system and led via the internal air channel under the piston surface of the actuator. Simply by reversing the actuator, it is possible to convert the fail-safe position of the valve (in single-seat valves) from spring-to-close (NC) to spring-to-open (NO). In these cases, or if the product or air supply pressure differs from the standard, check the definition of the actuator size based on the order code and the selection sheets onwards. In addition, the actuator permits additional pressurization of the spring chamber with up to 6 bar air supply, in order to increase the closing force by this method. To pressurize the spring chamber with air, it is recommended that a NOT-element should be used in the control and feedback system T.VIS® (see catalog GEA Valve Automation).

Reliable switching actuators are available for all relevant valve types with a control air pressure from 4 bar. Selection tables for choosing the required actuator size can be found at the end of this section.

ECOVENT® Actuator Air/Spring for Application without Feedback System

Typical application and description

A basic element of ECOVENT® valves, the actuator air/spring of the ECO-E/US type is used for performing the valve movements in all ECOVENT® valves without control top.

Simply by reversing the actuator, it is possible to convert the fail-safe position of the valve from spring-to-close (NC) to spring-to-open (NO). In these cases, or if the product or air supply pressure differs from the standard, check the definition of the actuator size based on the selection sheets.

Reliable switching actuators are available for all relevant valve types with a control air pressure from 4 bar. Selection tables for choosing the required actuator size can be found at the end of this section.

Options – Actuators

VARIVENT® Actuator Air/Spring,
Air-assisted

Typical application and description
For increasing the holding force of the actuator.

In addition to the function method of the VARIVENT® actuator air/spring, this actuator has another air connection to the spring side of the actuator. This connection enables the spring-side piston surface to be pressurized by compressed air.

To pressurize the spring side with air, it is recommended that a NOT-element should be used in the control and feedback system T.VIS® (see catalog GEA Valve Automation). For increasing the holding force of the actuator.

Options – Actuators

ECOVENT® Actuator Air/Spring, Air-assisted

Typical application and description
For increasing the holding force of the actuator.

In addition, the actuator permits additional pressurization of the spring chamber with up to 6 bar air supply, in order to increase the closing force by this method.

To pressurize the spring side with air, it is recommended that a NOT-element should be used in the control and feedback system T.VIS® (see catalog GEA Valve Automation).

Simply by reversing the actuator, it is possible to convert the fail-safe position of the valve from spring-to-close (NC) to spring-to-open (NO). In these cases, or if the product or air supply pressure differs from the standard, check the definition of the actuator size based on the selection sheets.

VARIVENT® Booster Cylinder for Actuator Air/Spring

Typical application and description

For increasing the size of the active pneumatic surface (piston surface) of the actuator.

The booster cylinder can be mounted in addition to the actuator so that the actuator can also be operated with low air supply pressure. In spring-to-close valves (valve type U with NO), the booster cylinder is installed below the actuator and in spring-to-open valves (valve type U with NC) between the actuator and control and feedback system. The booster cylinder is automatically supplied with compressed air via the internal air channel, an additional hosing is not necessary.

Options – Actuators

VARIVENT® Actuator Air/Air

Typical application and description

In the air/air actuator, both end positions are realized using pressurized air at the particular side of the piston. The actuator is not equipped with a spring in the inside.

If there is a failure with the air supply, the valve will remain in its particular position or its current position will be determined by the product pressure acting on the valve disc. For this reason, it is not permitted for an air/air actuator to be used on double-seat valves, because if there is a power failure the valve will not automatically return to its fail-safe position (closed position), but rather, the resulting position would be determined randomly based on the process conditions (product pressure or flow).

If an air/air actuator is required, please send your request to GEA Tuchenhausen stating the prevailing pressures (air supply and product pressure), nominal width and required valve type.

Options – Actuators

VARIVENT® Manual Actuator

Typical application and description

For manual operation and locking of the valve disk position of VARIVENT® valves.

The manual actuator is designed as a handwheel up to the nominal width DN 100 or 4". With larger nominal widths, the manual actuator is designed as a crank. The manual actuator can be locked in any position using a lock nut.

One full turn of the manual actuator results in a valve stroke of 11 mm, irrespective of the nominal width.

Options – Seal Materials
FFKM

Typical application and description

Perfluorinated rubber (FFKM) is an elastomer that is used in areas where particularly high thermal and/or chemical resistance properties are required.

FFKM seal material combines the chemical properties of PTFE and the mechanical properties of Viton, and is characterized by a wide range of application temperatures, very good resistance to fluids, low-pressure deformation and minimum swelling.

The mixing constituents of our FFKM gasket material comply with US Plastic Class VI and have been tested for acute systemic toxicity, intrataneous reactivity and intramuscular implantation in accordance with USP-NF 87 and 88.

The resistance of the sealing material depends on the type and temperature of the product being transported. The contact time with certain products can negatively effect the service life of the seals.

Detailed information on the properties of the sealing material can be found in the table with the material properties.

Options – Seal Materials Tefasep® gold

Typical application and description

TEFASEP® gold easily copes with sterilization processes at temperatures up to 160 °C and can also handle abrasive and aggressive media without any problems which is essential for pharmaceutical or biotechnological applications. The hard, stable material compound is impressive not only because of its chemical resistance but its robustness also prevents the cold flow familiar with other thermoplastics and as a result contributes significantly to process stability. Together with the valve design, the material ensures a minimum contact surface between the housing and the seal which, in turn, increases the cleaning capability of the process system.

Unlike an elastomer seal, the thermoplastic uniquely requires a cleaning cycle of 80 °C. As a result the O ring adjusts to the valve seat and seals the system hermetically. The new TEFASEP® gold differs from the well approved TEFASEP® gasket for GEA Aseptomag valves by its bronze-golden color.

Options – Surface Qualities

Inner and Outer Surface of the Housings

Typical application and description

Deviating from the quality of the standard surface quality, different surface qualities are available up to a medium roughness for surfaces in contact with the product of $R_a \leq 0.4 \mu\text{m}$. The outer surface of the housings is matt blasted as standard. Optionally, it can also be supplied ground.

Housings that should comply with the 3-A standard are produced as standard with an inner surface of $R_a \leq 0.8 \mu\text{m}$ with ground welds and a blasted outer surface. If a configuration with a ground outer surface is required, it is necessary to select not only option /3-A (position 13) but also the corresponding surface quality 3 (position 11).

Incorporation of the option in the order code and example

Position	Description of the order code for options																
11	Surface quality of the housing																
	2	Inside $R_a \leq 0.8 \mu\text{m}$, outside matt blasted															
	3	Inside $R_a \leq 0.8 \mu\text{m}$, outside ground															
	4	Inside $R_a \leq 0.4 \mu\text{m}$, outside matt blasted															
	8	Inside $R_a \leq 0.4 \mu\text{m}$, outside ground															
	5	Inside $R_a \leq 0.8 \mu\text{m}$, outside valve completely ground (only for valve type FDD, M, MC and MT)

Options – Surface Qualities

Electro-Polishing

Typical application and description

One process for improving the surface quality is electrochemical polishing, in which peaks on the surfaces of material are abraded by a galvanic process, resulting in an evened-out elevation profile.

This surface treatment makes it much less likely for contaminating substances and micro-organisms to stick to the surface. In addition, the smooth surface improves corrosion resistance by formation of an inert oxide layer.

Electropolishing of the housings is only available for housings that are outside grounded (order code position 11).

Options – Connection Fittings

Overview

Typical application and description

The valve housings can be specified with a welded-on connection fitting. To find which connection fittings are available, please refer to the list on the following pages.

If the vertical ports within a valve do have different configurations, please inform us of the designation for the particular housing port including the required connection fitting (as in the example below). The seal which may be included corresponds to the sealing material of the valve.

Connection fittings

TK	VARIVENT® flange connection, groove flange on housing
TN	VARIVENT® groove flange incl. O-ring and connecting parts
TF	VARIVENT® flange
GK	Pipe fitting, DIN 11851, male end on housing
GO	Male end SC, DIN 11851, incl. seal ring G
KO	Liner SD, DIN 11851, incl. groove nut
ASK	Hygienic flange connection, DIN 11853-2
NFK	Hygienic groove flange, DIN 11853-2
BFK	Hygienic flange, DIN 11853-2
CO	Clamp connection / TRI-Clamp, DIN 32676 (DN)/ ISO 2852 (OD; length: 28.5 mm)

VARIVENT® Flange Connection

Typical application and description

An O-ring is used for sealing the VARIVENT® flange connection, and is given a defined compression by a metal stop. The O-ring is also protected by the special geometry of the recess from being pulled out at high flow rates.

The VARIVENT® flange connection (TK) can be ordered either as a complete connection including bolts and nuts (TK) or a groove flange (TN)/flange (TF) as a connection fitting on a vertical port. If a complete connection is ordered as the connection fitting, the groove flange is welded onto the housing. The groove flange (TN) contains not only the O-ring but also the required connecting elements.

Options – Connection Fittings

Pipe Fitting acc. to DIN 11851

Complete connection
(GK)

Male end SC (GO),
including seal ring G

Liner SD (KO),
including groove nut

Typical application and description

A seal ring G is used for sealing the pipe fitting acc. to DIN 11851. The pipe fitting acc. to DIN 11851 can be ordered either as a complete connection (GK) or male end SC (GO)/liner SD (KO) as a connection fitting on a vertical port. If a complete connection is ordered on a housing port, the male end is welded onto the housing. The groove flange contains the seal ring G. The liner (KO) contains the groove nut.

GK – Complete connection, male end on housing

Hygienic Flange Connection acc. to DIN 11853-2

Complete hygienic
flange connection
(ASK)

Hygienic-groove
flange (NFK), including
connecting elements
and seal ring

Hygienic flange
(BFK)

Typical application and description

An O-ring is used for sealing the hygienic flange connection acc. to DIN 11853-2, and is given a defined compression by a metal stop. The O-ring is also protected by the special geometry of the recess from being pulled out at high flow rates. Furthermore, the flange connection is centered by the design shape. The sealing geometry of the hygienic flange connection corresponds to the aseptic flange connection acc. to DIN 11864-2.

The hygienic flange connection (ASK) can be ordered either as a complete connection including bolts and nuts (ASK) or a hygienic groove flange (NFK)/hygienic flange (BFK) as a connection fitting on a vertical port. If a complete connection is ordered on a housing port, the groove flange is welded onto the housing. The groove flange (NFK) contains not only the O-Ring but also the required connecting elements.

Clamp Connection (Tri-Clamp)

Typical application and description

The clamp connection acc. to DIN 32676 is a widely used connection fitting, in the food, chemical and pharmaceutical industry, especially in North America. The connection uses a symmetrically structured clamp connection with a seal located in between it, and is secured by a clamp.

The second clamp connection, the seal and the clamp are not supplied. Clamps with nominal width OD series are compatible to ASME BPE clamps. Clamp connections are also available for valves according to the requirements of the 3A.

The second clamp connection, the seal and the cramp are not supplied.

VARIVENT® Damping Cylinder

Typical application and description

To avoid water hammers when the valve disc of VARIVENT® valves is closed in the flow direction.

The oil-filled damping cylinder enables the closing speed of VARIVENT® valves to be kept constant throughout the entire stroke length. The closing speed can be set using an adjustable throttle valve on the bypass.

The application is recommended when the installed valve closes in the flow direction of the product, and cannot be converted to a valve variant intended for this flow direction.

VARIVENT® Two-position-stop

Typical application and description

Setting the coarse and fine flow when dosing or weighing at a bottling station.

With the two-position-stop (cylinder), a pneumatically operated valve can be moved to two reproducible positions in addition to the closed position. A partial stroke and a full stroke, or two partial strokes, can be set.

The two-position stop can be used for valves with upwards switch travel, such as spring-closing valves type N or spring-opening valves type U. The valve position can be detected by proximity switches mounted in the lantern.

Available nominal widths

Metric	DN	25–150

VARIVENT® Two-position-stop with T.VIS®

Typical application and description

Setting the coarse and fine flow when dosing or weighing at a bottling station.

With the two-position-stop (cylinder), a pneumatically operated valve can be moved to two reproducible positions in addition to the closed position. A partial stroke and a full stroke, or two partial strokes, can be set. The VARIVENT® Two-position-stop with T.VIS® can be used for valves with the non-actuated position open as well as closed.

This type was developed for valves that are also equipped with a T.VIS® A15 or T.VIS® E20 feedback system.

VARIVENT® Limit Stop

Typical application and description

Mechanically adjustable limit on the stroke.

The maximum stroke can be reduced by using a mechanically adjustable limit stop. The limit stop limits either the opening or the closing stroke of the valve. The minimum stroke is 5 mm.

It is not possible to install a proximity switch as a feedback function in the lantern!

NOTE: The limit stop can not be used simultaneously with a sterile lock.

VARIVENT® Sterile Lock for Single-seat Valves

Typical application and description

For reliable separation between the surface of the valve disc in contact with the product and the atmosphere.

Applying sterilizing media to the sterile lock prevents contamination of the product from atmosphere due to the switching movement of the valve stem (“elevator effect”).

In the case of media that tend to crystallise, the formation of crystals on the shaft can be prevented by applying a liquid to the flush lock, thereby protecting the seal against damage.

NOTE: The limit stop can not be used simultaneously with a sterile lock.

VARIVENT® Sterile Lock for Double-seat Valves, Complete

Typical application and description

For reliable separation between the surface of the valve disc in contact with the product and the atmosphere.

Applying sterilizing media to the sterile lock prevents contamination of the product from atmosphere due to the switching movement of the valve stem ("elevator effect").

In the case of media that tend to crystallise, the formation of crystals on the shaft can be prevented by applying a liquid to the flush lock, thereby protecting the seal against damage. If this option is selected with double-seat valves, both the upper and the lower stem feedthrough will be equipped with a sterile lock.

Options – Accessories
VARIVENT® Steam Lock PMO

Typical application and description

For reliable separation between the balancer surface of the lower valve disc in contact with the product and the atmosphere.

Applying steam or sterilizing media to the steam lock prevents contamination of the product from atmosphere due to the switching movement of the valve stem (“elevator effect”).

In the case of media that tend to crystallise, the formation of crystals on the shaft can be prevented by applying a liquid to the steam lock, thereby protecting the seal against damage.

VARIVENT® Balancer Cleaning Device

Typical application and description

The balancer cleaning device – available for **R, MX, and PMO** valves – offers the advantage of automatic external cleaning of the lower balancer, which is performed by lifting the lower valve disc. This option ensures maximum efficiency during valve cleaning, as not only the lower valve seat and the cavity chamber are cleaned during lifting, but also the outer surface of the balancer at the same time. This prevents possible contamination of the product from the atmosphere due to the switching movement of the valve stem ("elevator effect").

VARIVENT® Flush Valve

Typical application and description
Leakage detection in case of seal defects on the double-seal valve type C.

If there is no need to flush the leakage chamber in a double-seal valve type C, the valve can be equipped with only one flush valve. In this case, the flush valve is not used for flushing, but only for leakage detection in case of defects.

To modificate the double seal valve from two fluching valves to just one the plug SPV-C PVDF with part number 221-464.07 is required.

To drain leakages into the leakage pan a pipe 8 × 1 mm or a hose 8/6 mm can be connected to the flushing valve.

Double seal valves whose leakage chamber is to be flushed with cleaning media above a temperature of 80 °C are equipped with a metal cylinder and a piston made of PEEK.

Options – Additional Options

VARIVENT® CIP Connection

for Double-seat and Double-seal Valve

Typical application and description

Double-seat valves are equipped with a cleaning connection at the level of the lantern to supply the spray cleaning with cleaning media. In case of double-seal valves the seat area is cleaned by inserting CIP media into one of the two flushing valves. Both connections are supplied with cleaning media through a connection to a supply valve in the periphery. All necessary components as well as one meter PTFE-hose can be supplied with the valve directly or ordered as an assembly. For the cleaning of the seat area at double-seal valves one of the two flushing valves also has to be connected to CIP-Medium.

As an option for double-seat valves, it is also possible to make the spray cleaning connection a blind connection. Making the cleaning connection blind is only intended for transport purposes, to prevent dust or particles from penetrating the cleaning connection. During operation of the valve, it is not recommended for the cleaning connection to use such a blind.

Available nominal widths

Test Report and Inspection Certificate

Typical application and description

Optionally, the housings or all parts in contact with the product can be supplied with a test report 2.2 and/or an inspection certificate 3.1 acc. to EN 10204.

IMPORTANT: An inspection certificate for all components in contact with the product can only be produced if notification of this requirement is provided with the order. The inspection certificate 3.1 acc. to EN 10204 can only be issued subsequently for the housings. Unless special requirements are stated, the order code referred to below only covers issuing the inspection certificate 3.1 acc. to EN 10204 for the housings.

European standard EN 10204 in its 2004 edition defines the various types of test certificates that can be issued to the ordering party in accordance with the agreements in the order for delivery of metallic products.

Number	Type of test certificate	Content of the certificate	Confirmation of the certificate by
2.2	Test report	Confirmation of compliance with the order, specifying results of a non-specific test	The manufacturer
3.1	Inspection certificate 3.1*	Confirmation of compliance with the order, specifying results of a specific test	The manufacturer's acceptance officer independent of the production department

* Inspection certificates 3.1 can be selected either for the housing or for product wetted parts, incl. connection fittings or ADW2 (please specify when ordering).

Options – Additional Options
3-A Symbol

Typical application and description

3-A Sanitary Standards, Inc. is an independent, non-profit corporation dedicated to advancing hygienic equipment design for the food, beverage, and pharmaceutical industries. In particular, it represents the interests of three stakeholder groups in the US dairy industry with a common commitment to promoting food safety and the public health – regulatory sanitarians, equipment fabricators and processors. To achieve this purpose, it has produced guidelines which define various design requirements on components. In the area of seat valves, it is above all the standards 53-07 (compression type valves) and 85-03 (double-seat mixproof valves) that are relevant. Compliance with these design specifications is examined by an independent expert and confirmed by issuing a certificate. Almost the entire VARIVENT® and ECOVENT® valve series complies with these design specification in the standard design.

If the 3-A option is selected, compliance of the valve with the requirements of the standard is confirmed by means of a sticker on the component. Consequently, if this option is selected, it is necessary to comply with the standard in terms of identification as well.

Furthermore, when this option is selected, the welds of the port connections are ground smooth. The standard does not specify that this is mandatory, but it is in line with customer's preferences in this market. Valves that are intended to meet the 3A requirements are available with butt weld ends or with clamp connections.

IMPORTANT: The standard surface when this option is selected is "inside surface $R_a \leq 0.8 \mu\text{m}$, outside matt". Many customers in this market ask for the alternative surface quality "inside surface $R_a \leq 0.8 \mu\text{m}$, outside ground". If this is required, it must be selected separately at position 11 in the order code as a non-standard surface.

Options – Additional Options

ATEX

Typical application and description

The ATEX standard of the European Union actually includes two guidelines on the explosion protection subject, the ATEX Product Directive 2014/34/EU and 1999/92/EG. The abbreviation ATEX come from the French term ATmosphères EXplosibles.

VARIVENT® and ECOVENT® valves have been subjected to an ignition hazard assessment and do not have in the interior a potential source of ignition. Thus the directive 2014/34/EU (ATEX) is not applicable for the internal space of the valve.

A risk of ignition or explosion very rarely may occur from the actuator unit in case of an error so that the actuator comes within the scope of Directive 2014/34/EU and is labeled accordingly. The suitability is confirmed by the type-specific Declaration of Conformity of the manufacturer.

Incorporation of the option in the order code and example

Options – Additional Options ID Plates, TAG Numbers

Typical application and description

As a standard, the valves are provided with a nameplate for clear identification. All key information required for clear allocation of the valve, as well as technical data, is specified on the nameplate. The plate is glued onto the actuator.

Key data contained

Valve type	
Serial number	
Materials in contact with the product	Metallic material / seal material
Air supply pressure	Min./Max. [bar/psi]
Product pressure	Housing 1/2/3 [bar/psi]

Option /50 – engraved labeling plate for system identification number

In addition to the nameplate, the option /50 consists of an engraved labeling plate for the TAG number attached between the actuator and lantern using a key ring on the clamp connection.

Option /51 – metal labeling plate

The engraved labeling plate is attached between the actuator and lantern using a key ring on the clamp connection. Additional information can be recorded as well as the TAG number, customer designation and the valve type. In addition, the valve is identified with a nameplate.

Option /52 – System identification number

In addition to the nameplate sticker the valve can be labelled with a desired system identification number. The TAG number is assigned to the valve by means of a separate sticker on the actuator or control and feed-back system.

Manual Emergency Actuator

Typical application and description

For manual actuation of pneumatically operated VARIVENT® and ECOVENT® valves during a power failure, as well as for releasing the spring tension of the actuator during maintenance and installation work.

The emergency actuator NOH is designed for manual actuation of all pneumatically operated VARIVENT® and ECOVENT® valves during a system failure. This manual emergency actuator allows for the mechanical lifting of the valve disc during maintenance and installation work on all VARIVENT® and ECOVENT® valve types, thereby releasing the spring tension of the actuator. However, radial sealing mixproof valves with lift drives are an exception, as the emergency manual actuator cannot be used with these valves. Additionally, the emergency manual actuator is not required for the maintenance of the radial sealing single-seat valves types U_R and W_R.

Available nominal widths

Options – Additional Options
LoTo DISK LOCK

LoTo DISK LOCK

The Lock Out, Tag Out (LoTo) device is used to ensure a safe maintenance and commissioning of process plants. Energy sources will be locked and visually marked to prevent the unintentional movement of the valve.

The DISK LOCK for seat valves can be installed on all nominal sizes of GEA VARIVENT® single-seat and mixproof valves. This advanced solution with its increased safety blocks the activation of the actuator, so that the valve disk can no longer be moved. If the valve is used with any Control and Feedback Systems it needs to be taken off for locking the valve disk.

Locking the movement of the actuator

Valve disk is fixed
Advanced solution – increased safety
In the event of a water hammer, the valve remains closed
Slight deformation of stainless steel or gasket possible
In order to achieve 100 % water hammer safety, block & bleed needs to be applied additionally

Position description of the order code and example

Position	Description of the order code
1	Basic type HV_LoTo For hygienic valves
2	LoTo type DL DISK LOCK
3	Valve family VAR VARIVENT® valves

The code is composed as following, depending on the chosen configuration:

Position	1	2	3
Code	HV_LoTo	DL	VAR

Available nominal widths

Mixproof shut-off valves for CIP and gas applications	C, K
Mixproof valves with divert function	Y*, FDD
Tank bottom valves	N, U, T*

* LoTo can be applied for mixproof valves. When doing so the main stroke of the valve will be locked (with AIR or DISK LOCK). The single valve disks could still be activated (when using a lifting actuator). Hence, the engineering company or the plant operator needs to evaluate if further locks are needed.

Options – Additional Options

LoTo AIR LOCK

AIR LOCK

The Lock Out, Tag Out (LoTo) device is used to ensure a safe maintenance and commissioning of process plants. Energy sources will be locked and visually marked to prevent the unintentional movement of the valve.

The AIR LOCK is independent of the nominal size. With this solution, either the air connection on the actuator or controltop is locked. Hence, pneumatic actuation is no longer possible.

This solution is not designed to withstand water hammers.

Locking the air connection to the control top or actuator

Prevents the movement of the actuator
Simple solution (not protected against water hammers)
Does not stay at the valve permanently
only needed when locking the valve

Position description of the order code and example

Position	Description of the order code
1	Basic type HV_LoTo For hygienic valves
2	LoTo type AL AIR LOCK

Options – Actuator Selection – Sample Selection Method

VARIVENT® Actuator Air/Spring

1

Procedure for VARIVENT® shut-off valves type N

- Depending on the valve type, select the required table on one of the following pages.
- The available air supply pressure indicates which rows to refer to for the actuator size.
- Select the prevailing product pressure in order to define the required row.
- Select a double column based on the nominal width of the valve.
- The fail-safe position of the valve defines the precise column.
- Select the necessary actuator size at the intersection between the row and the column.

Spring-to-open (NO)

Options – Actuator Selection – Sample Selection Method

Procedure for VARIVENT® double-seat valves with lift function type D_L and D_C

1. Depending on the valve type, select the required table on one of the following pages.
2. The available air supply pressure indicates which rows to refer to for the actuator size.
3. Select the prevailing product pressure in order to define the required row.
4. Select a double column based on the nominal width of the valve.
5. Select the necessary actuator size at the intersection between the row and the column.

Actuators R..., S..., T... and U... are made up of the actuator air/spring type S and booster cylinders as follows:

R...	=	actuator D	+ booster cylinder D
S...	=	actuator E	+ booster cylinder D
T...	=	actuator E	+ booster cylinder E
T...6	=	actuator E...6	+ booster cylinder E
U...6	=	actuator S...6	+ booster cylinder E

If there are different product pressures in the valve housings, this can result in different actuator sizes which cannot be found in the table. Please contact us in this case.

For a detailed description of the composition of actuator/booster cylinders, please refer to the VARIVENT® booster cylinder page on the actuator air/spring.

Options – Actuator Selection

VARIVENT® Actuator Air/Spring

For VARIVENT® Shut-off Valves Type N

with TEFASEP® Gold Seat Gasket

The standard configuration has 6 bar air supply pressure for 5 bar product pressure (see grey mark in the table). The particular product and air supply pressure must be specified when ordering. If you do not provide any further information about the pressures when ordering, we will supply the standard configuration.

“L + actuator designation” indicates that this combination is only possible if the spring has air assistance. In this case, the actuator must be assisted by the corresponding air supply pressure (left column). The air pressure for assisting the actuator spring is allowed to be max. 6 bar (87 psi).

Options – Actuator Selection
VARIVENT® Actuator Air/Spring
For VARIVENT® Shut-off Valves Type U

The standard configuration has 6 bar air supply pressure for 5 bar product pressure (see grey mark in the table). The particular product and air supply pressure must be specified when ordering. If you do not provide any further information about the pressures when ordering, we will supply the standard configuration.

Actuators R..., S..., T... and U... are made up of the actuator air/spring type S and booster cylinders as follows:

R...	=	actuator D	+ booster cylinder D
S...	=	actuator E	+ booster cylinder D
T...	=	actuator E	+ booster cylinder E
T...6	=	actuator E...6	+ booster cylinder E
U...6	=	actuator S...6	+ booster cylinder E

If there are different product pressures in the valve housings, this can result in different actuator sizes which cannot be found in the table. Please contact us in this case.

For a detailed description of the composition of actuator/booster cylinders, please refer to the VARIVENT® booster cylinder page on the actuator air/spring.

Options – Actuator Selection

VARIVENT® Actuator Air/Spring

For VARIVENT® Divert Valves Type W

with TEFASEP® Gold Seat Gasket

The standard configuration has 6 bar air supply pressure for 5 bar product pressure (see grey mark in the table). The particular product and air supply pressure must be specified when ordering. If you do not provide any further information about the pressures when ordering, we will supply the standard configuration.

“L + actuator designation” indicates that this combination is only possible if the spring has air assistance. In this case, the actuator must be assisted by the corresponding air supply pressure (left column). The air pressure for assisting the actuator spring is allowed to be max. 6 bar (87 psi).

Options – Actuator Selection

VARIVENT® Actuator Air/Spring

For VARIVENT® Divert Valves Type X

The standard configuration has 6 bar air supply pressure for 5 bar product pressure (see grey mark in the table). The particular product and air supply pressure must be specified when ordering. If you do not provide any further information about the pressures when ordering, we will supply the standard configuration.

Actuators R..., S..., T... and U... are made up of the actuator air/spring type S and booster cylinders as follows:

R...	=	actuator D	+ booster cylinder D
S...	=	actuator E	+ booster cylinder D
T...	=	actuator E	+ booster cylinder E
T...6	=	actuator E...6	+ booster cylinder E
U...6	=	actuator S...6	+ booster cylinder E

If there are different product pressures in the valve housings, this can result in different actuator sizes which cannot be found in the table. Please contact us in this case.

For a detailed description of the composition of actuator/booster cylinders, please refer to the VARIVENT® booster cylinder page on the actuator air/spring.

Options – Actuator Selection

If there are different product pressures in the valve housings, this can result in different actuator sizes which cannot be found in the table. Please contact us in this case.

Options – Actuator Selection VARIVENT® Actuator Air/Spring For VARIVENT® Double-seat Bottom Valves Type T_R

The standard configuration has 6 bar air supply pressure for 5 bar product pressure (see grey mark in the table). The particular product and air supply pressure must be specified when ordering. If you do not provide any further information about the pressures when ordering, we will supply the standard configuration.

GEA Valve Automation – Control and Feedback Systems

Valve automation for increased process reliability, efficiency and flexibility

GEA's hygienic valve technology sets the standards for reliable, safe and permanently efficient liquid processes. Leading-edge control and automation options enable operators to achieve optimum control and monitoring of the valve – thereby realizing state-of-the-art, highly flexible operating and automation concepts.

The key component is the latest generation of GEA control tops with reliable, ground-breaking control and feedback technology. Mechanical valve components and a control top specified for the particular application together form a finely tuned valve unit capable of realizing advanced system concepts and enhancing process options.

The control top – integral part of the valve unit

The control top facilitates optimized production and cleaning processes with less expenditure on staff, energy and time. Valve functions can be automatically and continuously monitored, recorded, evaluated and if necessary, corrected. Detectable valve positions make a crucial contribution towards the achievement of optimum system operation. This ensures

adherence to a smooth process flow, while also achieving the utmost in product safety.

Special priority is given to sustainability in intelligent valve control: Thanks to the selectable LEFF® function integrated in the T.VIS® A-15, up to 90 percent of cleaning agents can be saved by an optimized and PLC-independent pulsing of the valve discs during the cleaning process. The economical air guidance in the control top and the integrated solenoid valves with low power intake minimize energy consumption as well as the demand for compressed air and the number of hose connections.

In addition, the control top offers the best protection to components against adverse ambient conditions such as moisture, dust, liquids of any kind, vibrations and other mechanical impact.

Modern plant communication at the threshold to industry 4.0

The control tops in the current GEA range can be configured for all common types of connection and control systems to make future-oriented, pioneering automation functions possible. For example, users can ensure early digital integration of their system control setup in Industry 4.0 environments by way of the modern IO-Link technology. Digital exchange of data enables central setting of component parameters and lossless information transfer.

Diagnostic data from the valve can be processed and displayed in central control unit of the plant. The options even extend to networking the system controller with the company's ERP system for optimized resource utilization.

Easy start-up

Thanks to pre-configurable system parameters and a fully automatic SETUP, the installation for digital valve control is easy even also without extensive technical knowledge. Regional requirements, application-specific certificates (UL/CSA/PMO/ATEX) and other individual specifications can be provided as needed.

As a true pioneer with decades of experience in the development of valves and control tops for all processes, GEA offers the perfect symbiosis of mechanical and electronic engineering, largely with standardized components. Extensive tests and countless valve units installed around the world have continuously proved the reliability and cost-effectiveness for the user, always ensuring maximum safety of operation.

Recommended control and feedback systems for GEA VARIVENT® seat valves

The T.VIS® M-20 offers an attractively priced basic version of control and feedback technology for seat valves with optimum adaptation to process conditions. The T.VIS® M-20 is fitted with self-learning sensors and is available for all established types of communication such as 24VDC, As-i and DeviceNet.

The T.VIS® A-15 offers extended functional scope and greater ease of operation. Besides the established types of communication, this control top also features the groundbreaking

IO-Link technology, which allows users to set the parameters for components centrally in the system via digital data exchange and transfer all process data loss-free. Thanks to a fully automatic setup, commissioning can be quickly and easily carried out by means of the push buttons fitted on the hood. Additional functions such as the selection of different tolerance bands, signal attenuation and the resource-saving LEFF® function round off the T.VIS® A-15.

Especially for GEA VARIVENT® mixproof valves, the T.VIS® A-15 provides the optimum solution, guaranteeing efficient processes and lower operating costs.

For control applications the T.VIS® P-15 positioner combination with an air-spring actuator provides a cost-efficient alternative to conventional control valves with diaphragm actuators. The valve can be moved to any position.

Attention must be paid to regional requirements for use in explosive areas. The SES meets the requirements of the European ATEX Directive and can be used in Zones 1 and 20. The T.VIS® A-15 is certified in accordance with the Directive Class 1 / Div. 2 in compliance with the regulations in place for the North American market.

Complete Order Codes

Mixproof Divert Valves

The complete order code makes it possible to assemble an order code for a non-standard configuration. All possible options for the valve in question are included.

When ordering a valve, specify not only the order code but also any required connection fittings as well as the air supply and product pressure. Unless specific pressure values are stated, the actuators for valves will be configured for 6 bar air supply pressure and 5 bar product pressure.

Position	Description of the order code	Available for valve type	
1	Valve type	Y	X_R

Our service package for dependable valve technology

With a tailored service concept, you can extend the service life of your hygienic valve technology. Professional services and original spare parts from GEA help to ensure maximum system availability and security, smooth operation and precise process execution.

Our service specialists are here to help you in every phase of system utilization – from the initial process concept and throughout the entire performance period to advising on your best strategies for the future.

Beginning of life services

We draw on our decades of experience to support you in configuring your system and providing extensive employee training. Our consultations and training sessions take place in our Competence Centre in Büchen or, upon request, at your premises.

Lifetime services

We optimize your spare parts logistics by using our modular component system and our extensive service network. Preventive maintenance programmes based on comprehensive data, routine troubleshooting and efficient repair logistics keep downtimes to a minimum.

Extended life services

When upgrades are available to enhance your system, you benefit from our continuing advances in hygienic valve technology. We offer extensive advice and consultation.

Consulting and enhanced operations

Working in partnership with you, we support your enduring success and develop service strategies and Service Level Agreements for a profitable future operation.

Description of Certificates

3-A		3-A Sanitary Standards, Inc. (3-A SSI) is an independent, non-profit corporation dedicated to advancing hygienic equipment design for the food, beverage, and pharmaceutical industries.
24/7 PMO VALVE 2.0® NON-STOP PRODUCTION		24/7 PMO VALVE® is a registered trade mark of GEA Tuchenhausen GmbH. It describes double-seat valves that have been authorized for use in PMO-regulated systems for carrying out the seat lift in order to clean the leakage chamber while the other pipeline is carrying product. This grants system operators the possibility of cleaning all valve components in contact with the product in parallel with the production process. In this way, the valves permit uninterrupted production on a 24/7 basis.
AS-i		Actuator Sensor interface. BUS system for the lowest field level.
ATEX		Atmosphères Explosibles. ATEX comprises the directives of the European Union in the area of explosion protection. Complies with the applicable requirements of ATEX directives: 2014/34/EU.
CCCEX		Complies with the applicable requirements of CCCEX directives in China.
cCSAus		Test of a product by CSA according to applicable safety standards in Canada and the USA.
CE		Conformité Européenne. By affixing the CE mark, the manufacturer confirms that the product complies with the European directives 765/2008 applicable to the specific product.
CSA		Canadian Standards Association. A non-governmental Canadian organization which issues standards as well as checking and certifying the safety of products. It is now globally active.
cULus		Test of a product by UL according to applicable safety standards in Canada and the USA.
DeviceNet		BUS system of the ODVA organization for complex communication on various field levels.
EG 1935/2004*		Materials in contact with the product used in valves from GEA Tuchenhausen GmbH are in accordance with EC regulation 1935/2004. This defines a general framework for materials and objects intended to come into contact with foodstuffs.
EHEDG		The guidelines drawn up by the European Hygienic Engineering and Design Group serve to implement food safety. The aim of the organisation is to improve compliance with the hygienic design of components and technical expertise in the industry. This also includes the ease of cleaning the equipment.
FDA		Food and Drug Administration. US supervisory authority for foodstuffs and pharmaceuticals. This authority issues approvals and certificates for products and materials that are used in the foodstuffs and pharmaceuticals industries.
IECEX		IECEX: International Electrotechnical Commission System for Certification to Standards Relating to Equipment for Use in Explosive Atmospheres. Complies with the applicable requirements according to IECEX directives.
ODVA		ODVA is a worldwide association comprising leading automation companies. It develops network protocols and standards in the joint interests of its members, which are used for the international interoperability of production systems.
TÜV		Technischer Überwachungs-Verein. The German TÜV is a private company which carries out technical safety checks as prescribed in national legislation or regulations.
UKCA		UK Conformity Assessed. By affixing the UKCA marking, the manufacturer confirms that the product complies with the product-specific applicable UK regulations.
UKEx		UKEx includes the guidelines for Great Britain. Complies with applicable requirements acc. UKEx Directive: UKSI 2016: 1107.
UL		Underwriters Laboratories. An organization founded in the USA for checking and certifying products and their safety.

* not possible for HNBR

Abbreviations and Terms

Abbreviation	Explanation
°C	Degrees Celsius, unit of measurement for temperature
°F	Degrees Fahrenheit, unit of measurement for temperature
3-A	Standard of 3-A Sanitary Standards, Incorporated (3-A SSI)
3D	Three-dimensional
A	Ampere, unit of measurement of current intensity or Output, term used in automation
AC	Alternating Current
ADI free	All elastomer compounds are free of animal-derived ingredients
AISI	American Iron and Steel Institute, association of the American steel industry
ANSI	American National Standards Institute, American body for standardizing industrial processes
approx.	approximately
AS-i	Actuator Sensor interface, standard for fieldbus communication
ASME	American Society of Mechanical Engineers, professional association of mechanical engineers in the USA
ASME-BPE	Standard of the ASME's – bioprocessing equipment association
ATEX	Atmosphères Explosibles, synonymous with the directives of the European Union for potentially explosive areas
bar	Unit of measurement for pressure. All pressure values [barg/psig] refer to positive pressure [bar _g /psi _g], unless specifically stated otherwise.
bar _g	Unit of measurement for pressure relative to atmospheric pressure
CAN	Controller Area Network; asynchronous serial bus system
CE	Conformité Européenne, administrative symbol for the free movement of industrial products
CIP	Cleaning In Place, designates a process for cleaning technical process systems.
CRN	The Canadian Registration Number is issued by a Canadian Jurisdiction and covers pressurized components. The authorization is needed to operate these components in Canada.
CSA	Canadian Standards Association, a non-governmental Canadian Standardization organization
dB	Decibel, one tenth of a bel, named after Alexander Graham Bell and used for identifying levels and dimensions
DC	Direct Current
DIN	Deutsches Institut für Normung e. V. Standardization organization in the Federal Republic of Germany, DIN = synonym for standards issued by the organization
DIP	Dual Inline Package, design of a switch
DN	Diameter Nominal, DIN nominal width
Device Net	Network system used in the automation industry to interconnect control devices for data exchange
E	Input, term used in automation
EAC	Certification of technical conformity from the customs union of Russia/Balarus/Kazakhstan
EG No. 1935/2004	Regulation of the European Parliament which lays down common rules for materials which come, or may come, into contact with food, either directly or indirectly.
EHEDG	European Hygienic Engineering and Design Group. Consortium of equipment manufacturers, food industries, research institutes as well as public health authorities
EN	European standard, rules of the European Committee for Standardization
EPDM	Ethylene propylene diene rubber, acronym acc. to DIN/ISO 1629
Ex	Synonym for ATEX
FB	Feedback
FDA	Food and Drug Administration, official foodstuffs monitoring in the United States
FEM calculation	Finite Element Method; calculation process for simulating solids
FKM	Fluorinated rubber, acronym acc. to DIN/ISO 1629
H	Henry, unit of measurement for inductance
HNBR	Hydrated acrylonitrile butadiene rubber, acronym acc. to DIN / ISO 1629
Hz	Hertz, unit of frequency named after Heinrich Hertz
I	Formula symbol for electrical current
IEC	International Electrotechnical Commission, international standardization organization for electrical and electronic engineering
IP	Ingress Protection / International Protection, index of protection class acc. to IEC 60529
IPS	Iron Pipe Size, American pipe dimension
ISA	International Society of Automation, international US organization of the automation industry

Abbreviations and Terms

Abbreviation	Explanation
ISO	International Organization for Standardization, international organization that produced international standards, ISO = synonym for standards from the organization
kg	Kilogram, unit of measurement for weight
Kv	The Kv value corresponds to the water flow rate through a valve (in m ³ /h) at a pressure differential of 0.98 bar and a water temperature of 5 °C to 30 °C.
Kvs	The Kv values of a valve at nominal stroke (100 % opening) is designated the Kvs value
L	Conductive
LED	Light-Emitting Diode
LEFF®	Function of the T.VIS® valve informations system for cyclical pulsing during the lifting process; Low-Emission Flip Flop
LoTo	Abbreviation for lockout – tagout, is an occupational health and safety procedure in which all energies of systems that could be dangerous for employees are isolated, interlocked and marked
mm	Millimeter, unit of measurement for length
M	Metric, system of units based on the meter or Mega, one million times a unit
m ³ /h	Cubic meters per hour, unit of measurement for volumetric flow
max.	Maximum
NAMUR	Standardization working association for measuring and control technology in the chemical industry, synonym for the interface type of the organization, especially for potentially explosive atmospheres
NC	Normally Closed; valve or solenoid valve control which is closed in idle status
NO	Normally Open; valve or solenoid valve control which is open in idle status
NOT-element	Logic element, NOT gate
NPN	Signal transmission against reference potential, current-consuming
NPT	National Pipe Thread, US thread standard for self-sealing pipe fittings
OD	Outside Diameter, pipe dimension
ODVA	Open DeviceNet Vendor Association, global association for network standards
PA 12/L	Polyamide
Pg	Armoured thread
PMO	Pasteurized Milk Ordinance
PN	Nominal pressure for pipeline systems according to EN 1333, rated pressure in bar at room temperature (20 °C)
PNP	Signal transmission against reference potential, current-supplying
Pressure Equipment Directive 2014/68/EU	Directive of the European Parliament and the Council Directive for layout and conformity evaluation for pressure equipment and assemblies with a maximum pressure (PS) of more than 0.5 bars.
PPO	Polyphenylene oxide, thermoplastic material
PS	Maximum permitted operating pressure at which the components can operate safely at maximum allowable temperature (TS)
psi	Unit of measurement for pressure, pound-force per square inch, 1 psi = 6894.75 Pa. All pressure values [bar/psi] refer to positive pressure [bar _g /psi _g], unless specifically stated otherwise.
psi _g	Unit of measurement for pressure relative to atmospheric pressure
PV	Solenoid valve
R _a in µm	Average roughness value, describes the roughness of a technical surface
International Protection-Code IP67, IP66, IP69	Classifies and rates the degree of protection provided against intrusion dust, accidental contact, and water
SET-UP	Self-learning installation, the SET-UP procedure carries out all necessary settings for generating messages during commissioning and maintenance.
SIP	Sterilization in Place, refers to a process for cleaning technical process systems
SMS	Svensk Mjöl Standard, Scandinavian pipe dimension
SW	Indicates the size of a tool spanner, “Schlüsselweite”
TA-Luft VDI 2440	If a product is certified according to TA Luft it meets the requirements for proof of high grade performance according to TA Luft of 1.0× 10 ⁻⁴ mbar x l / (s x m) at service conditions under the VDI guideline 2440. The product will hence be tested for tightness.
TEFASEP® gold	Brand name for GEA's proprietary valve seat seal (hard sealing)
T.VIS®	GEA Tuchenhausen valve information system, control top system from GEA Tuchenhausen

Abbreviation	Explanation
TS	Maximum permitted operating temperature
UL	Underwriters Laboratories, a certification organization established in the USA
USP Class VI	The United States Pharmacopeial Convention (USP) is a scientific nonprofit organization that sets standards to help protecting public health. Class VI administer tests and impacts of material and their substances on animal and human tissues.
UV	Ultraviolet, ultraviolet radiation is a wavelength of light
V	Volt, unit of measurement for voltage
VARICOMP®	Pipe expansion compensator from GEA Tuchenhausen
VMQ	High-polymer vinyl methyl polysiloxane, silicone rubber, MVQ = synonym
W	Watt, unit of measurement for power
Y	Control air connection for the working cylinder, designation from pneumatic systems
μ	Micro, one millionth of a unit
Ω	Ohm, the unit of electrical resistance named after Georg Simon Ohm

CAD Files

Typical application and description

You can receive two-dimensional and/or three-dimensional drawing files of our components for making your piping planning. For this purpose, please send us your specific request, stating the particular order code and the required drawing format. The required files will then be individually prepared for you.

Available drawing formats:

	Format	Name
2D formats	drw	Native Pro/E
	igs (2D)	IGS file
	dxf	AutoCAD drawing exchange
	pdf (2D)	Adobe Acrobat document
	tif	TIFF (plot)
3D formats	asm	Native Pro/E
	igs (3D)	IGS file
	pdf (3D)	Adobe Acrobat document
	stp	STP file
	bmp (3D)	Bitmap image
	jpg (3D)	JPEG image
	tif (3D)	TIFF image
	sat	Standard ACIS

General Sales Terms and Condition of Delivery

Please note

All our sales and/or services are exclusively subject to our valid terms and conditions of sale and/or service applicable in the respective country of business, which can be found on our internet platform: www.gea.com.

If not available or if you otherwise wish to receive such terms and conditions directly from us, please contact us and we of course will send you the applicable version of our terms and conditions for the envisaged business.
